

# Gerotor Pumps Product series 143

For oil, for use in SKF CircOil centralized lubrication systems

# Gerotor pumps, product series 143

SKF gerotor pump units of product series 143 are self-priming positive-displacement pumps with fixed displacement and high efficiency. They are used in SKF CircOil centralized lubrication systems for a variety of tasks and applications, especially in circulating-oil and total-loss lubrication systems.

## Fields of application:

- General mechanical and plant engineering
- Shipbuilding and offshore industry
- Paper, printing, and pulp industries
- Heavy industry

## Advantages:

- Flexible delivery range from 0.85 to 50 l/min at system pressures up to 50 bar
- Large viscosity range for standard mineral and synthetic lubricating and hydraulic oils from 20 to 1000 mm<sup>2</sup>/s

- Ambient temperature of 0 to +40 °C
- Low volumetric flow pulsation and thus very smooth running
- Gerotor with a cycloid contour and thus good suction characteristics
- Low-noise
- Gerotor pumps are available in NBR and FKM designs.
- Squirrel cage motors are available in different voltage designs for 50 and 60 Hz
- Compact design
- Modular ordering system (order as a complete pump unit, single pump, or pump with flange and shaft coupling)

## Fundamentals

### General use

SKF gerotor pump units of product series 143 are used in circulating-oil and total-loss lubrication systems in a flow rate range of 0.85 to 50 l/min. The standard permissible ambient temperature is between 0 and +40 °C. Higher ambient temperatures are possible, though they lead to a reduction in motor performance and thus the delivery rate. The permissible temperature of the pumped medium is between 0 and +80°C. The gerotor pumps are available in NBR and FKM designs.

SKF gerotor pump units feed lubricating and hydraulic oils from a reservoir and into the pipe system of a centralized lubrication system. In doing so, they increase the energy of the pumped medium (pressure increase) to overcome flow resistance in the pipelines (pressure loss), the components (filters, valves, distributors) and the bearings and friction points. SKF gerotor pump units of different types and performance ratings are used depending on the type and size of the centralized lubrication system and the lubricant.

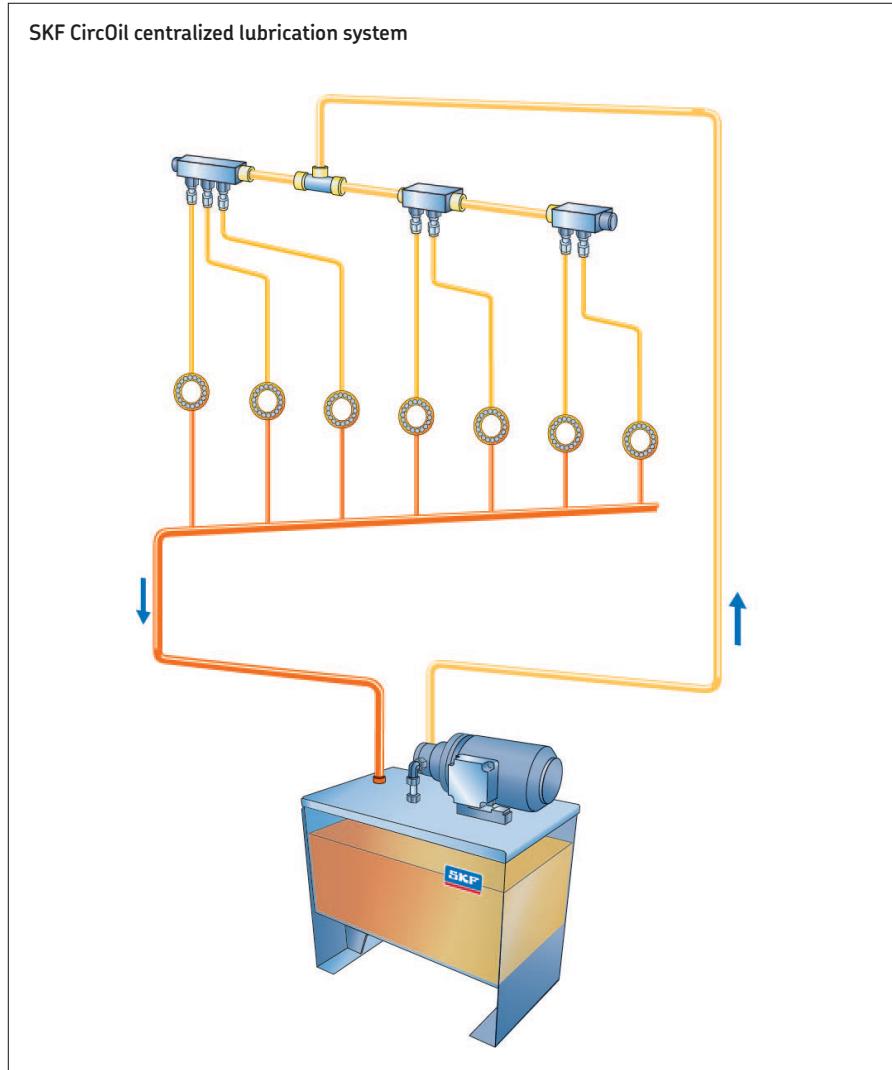

### Applications

The main area of application is the broad field of circulating-oil and total-loss lubrication systems for general mechanical engineering and plant engineering applications. Here, the focus is on lubricating and cooling heavily loaded bearings and friction points for a wide range of uses. SKF gerotor pump units are used primarily as lubricating, hydraulic, hydrostatic, and cooling oil pumps. They can be set up either as single pumps or integrated into a reservoir unit. Other areas include the shipbuilding and offshore industry as well as the paper, printing, pulp, and heavy industries.

### Delivery rates and characteristic curves

The nominal delivery rates indicated in the catalog refer to the nominal output multiplied by the speed of the motor. The actual delivery rate changes with operating viscosity and back pressure and can be found in the characteristic curve diagrams in the catalog (→ page 12–13). These diagrams are based on the range between 20 and 1000 mm<sup>2</sup>/s in increments of 20, 140, 750, and 1000 mm<sup>2</sup>/s. Each gerotor pump has a characteristic curve represented as a function of the delivery rate above the delivery pressure (back pressure).

It is important to note that temperature influences can render lubricating and hydraulic oils extremely thin or viscous. Please consult with us in advance if you will use lubricating and hydraulic oils with an operating viscosity outside the specified range.

# Gerotor pumps, product series 143

## Fundamentals

### Design (→ Figure 1)

SKF gerotor pump units of product series 143 have a constant displacement volume and one delivery circuit. The annular-toothed feeding element, also referred to as the gerotor, is equipped with a cycloid contour, which creates a large tooth meshing length. This yields a low volumetric flow pulsation and thus very smooth running, low noise production, and good suction characteristics.

SKF gerotor pumps consist primarily of pump housing (1), the shaft (2), the displacement elements toothed rotor (3) and annular gear (4), and the lid (5)..

### Suction and displacement process (→ Fig. 1)

The shaft drives the centrally mounted toothed rotor in the indicated direction of rotation via a feather key. The toothed rotor meshes with the outer, eccentrically mounted annular gear and rotates with it. The openings between teeth arising in the suction area (**S**) draw the pumped medium in. The suction and pressure area is separated from the tooth meshing area (**Z**) by a radial gap (**R**) formed by the tooth profiles of the annular gear and the toothed rotor as they slide onto one another. In the pressurized area (**P**), the fluid is fed to the pressure port through increasingly small chambers.

### Drive

SKF gerotor pump units of product series 143 are driven by IEC squirrel cage motors sized 63 to 132 in the standard design. The motors are designed for a rated motor voltage of 230/400 V or 400/690 V for 50 networks according to DIN IEC 60038. The normal coils used here in motors with performance  $\leq 0.75$  kW are designed for the wide voltage range. The normal coils in motors with performance  $\geq 0.75$  kW are tailor-made and meet the IE3 efficiency level according to EU Directive 2009/125/EC. Special voltage versions with special coils for 50 Hz and 60 Hz networks are available for order.

The standard design of the motors comes with a terminal box. Motors with UL/CSA certification are available. Further certifications are available on request.

### Shaft coupling

The shaft couplings are designed as curved-tooth couplings. Curved-tooth couplings are flexible shaft connections for positive torque transmission. The material combination of steel hub and polyamide sleeve used for the curved-tooth couplings permits maintenance-free continuous duty with very low friction on the teeth. They, therefore, do not require any lubrication or maintenance and are nearly wear-free in operation.

### Installation

SKF gerotor pump units of product series 143 can be installed both horizontally and vertically. Foot or flange versions are available for each gerotor pump unit design.

When the gerotor pump unit is set up separately from the reservoir, the suction port on the pump can be connected to a reservoir at a higher position (max. 2000 mm).

To flange the gerotor pump unit to a reservoir horizontally below the oil level, use a sealed pump in a special design. Please consult our Engineering department in advance.

In its design as a pump with flange and coupling, various technical designs of customer-specific electrical motors can be used. The flange allows for the installation of all IEC standard motors with a flange according to DIN EN 50347, design FT (with threaded holes). See the drawings in this publication for the geometric dimensions of the flange.

If only gerotor pumps without a motor are used, for example as an integrated/attached pump on a machine housing, ensure that no radial or axial load is applied to the drive shaft. The pumps can be installed in any position.

## Technical data

Gerotor pump unit in foot design

Gerotor pump unit in flange design

Gerotor pump

Table 1

### Technical data

Lubricant	standard mineral, synthetic lubricating and hydraulic oils
Operating viscosity	20–1000 mm <sup>2</sup> /s
Flow range	0,85–50 l/min
Operating pressure	up to 50 bar
Ambient temperature range	0 to +40 °C
Medium temperature range	0 to +80 °C
Protection class acc. to DIN EN 60529	IP 54
Operating noise level	60 dBA
Drive speed depending on design	1400 and 2800 min <sup>-1</sup>
Suction head, max.	1000 mm
Varnishing	RAL 7024 graphite grey, special painting optional
Duty type per VDE 0530	S1
Sealing material	NBR, FKM
Mounting position	horizontal, vertical
<b>Materials</b>	
Pump housing	hydraulic cast (pressure-proof) with good wear and antifriction properties
Gerotor insert	sintered material
Shafts	low-deformation steels, case-hardened
Bearing	SKF plain bearing

### General notes on usage

During commissioning, pay attention to the pump's direction of rotation. See the rating plate and motor rotation arrow on the pump.

If using the pumps in systems without any open pressure lines, provide pressure-regulating valves to limit the maximum pressure of the system.

The selected cross-section of the intake tube must be equal to or greater than the cross-section of the pump's suction port.

SKF Lubrication Systems Germany GmbH recommends the use of filters for trouble-free operation of the pumps or pump units. Effective filtration prevents malfunctions while also increasing the service life of the pumps. A pumped medium of at least the purity class 20/17/14 according to ISO 4406(c) is recommended. This corresponds to the U.S. standard NAS code (1638) class 8 and SAW AS 4059 class 8. A filter rating of approx. 5 - 10 µm meets this requirement. The filter rating used is always based on the most sensitive component in the entire system. This is not necessarily the pump.

 3) Nominal delivery rate at motor speed 1400/2800 min<sup>-1</sup> acc. to number of motor pins.

## Order example

**143-11ND03E-RA+1FX**

- Gerotor pump unit PS 143
- Motor in foot design
- Sealing NBR
- Nominal delivery rate 1.7 l/min
- Back pressure 30 bar
- Motor index 0.37 kW
- Terminal box on right
- Motor certification CE
- 220–240 V / 380–420 V, 50 Hz
- 254–280 V / 440–480 V, 60 Hz

If ordering the gerotor pump+pump flange+shaft coupling (model design 3) the identification letters of terminal box position, motor certification and voltage code is omitted

Example: **143-13ND03E**

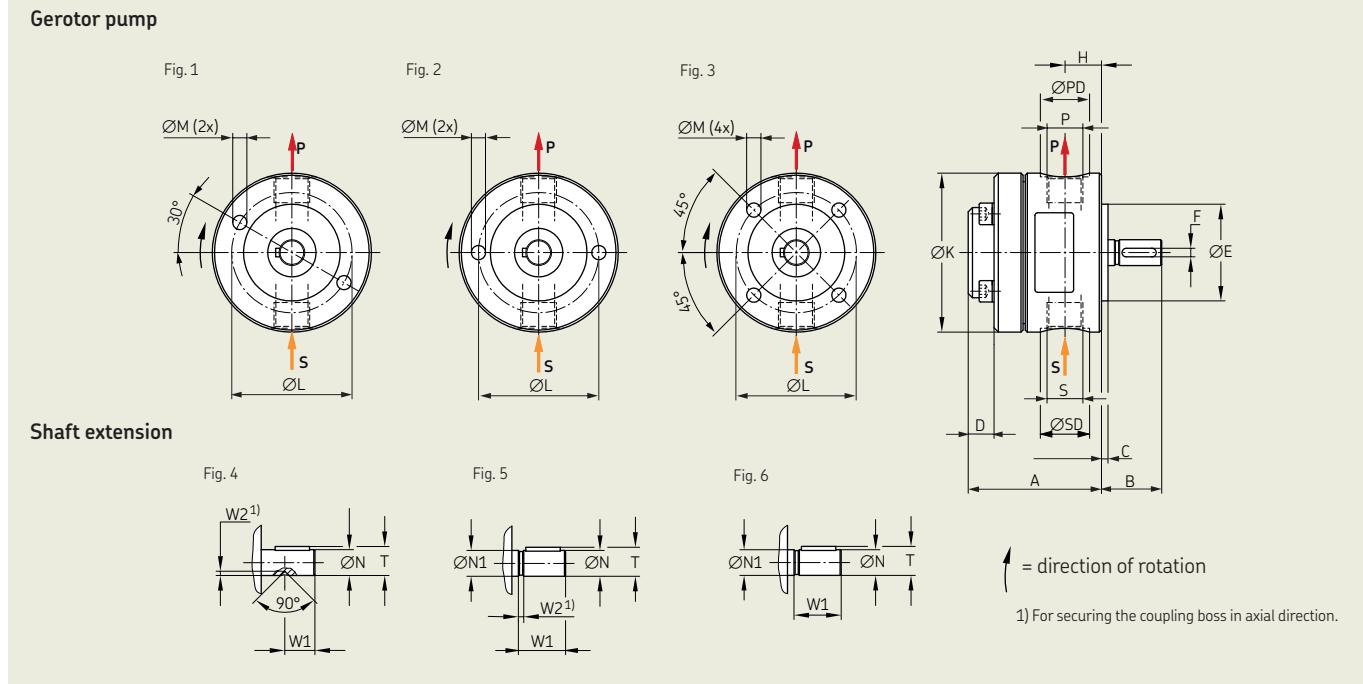

If ordering the gerotor pump (model design 4) the identification letters of terminal box position, motor certificate and voltage code is omitted, also item 4 of the code for the pump design

Example: **143-14ND03**

# IEC squirrel cage motors

## Fundamentals

### General information

The standard design of SKF gerotor pump units of product series 143 is driven by IEC asynchronous motor. The motors are used in sizes 63 to 132, in 2-pole and 4-pole designs. They meet the relevant IEC/EN standards both mechanically and electrically. The standard design of the motors comes with a terminal box. The motors bear a CE marking in accordance with Low Voltage Directive 2014/35/EC. There is no CE marking with respect to Machinery Directive 2006/42/EC and EMC Directive 2014/30/EC because asynchronous motors do not fall under the scope of these Directives.

### Special provisions

The motors can be ordered in a UL- and CSA-compliant design and are approved as a „recognized component“ by UL (Underwriter Laboratories).

These motors have an electrical design according to NEMA MG1-12.

CSA BG56-80 File-No.: LR 88093 (listed under Master Contract No. 150227)

CSA BG90-132 File-No.: LR 12638 (listed under Master Contract No. 150227)

UL BG56-80 File-No.: E123665 (combined acceptance per UL 1004 and CSA 22.2.100)

UL BG90-132 File-No.: E125750 (combined acceptance per UL 1004 and CSA 22.2.100)

Further certifications are available on request.

### Types

The motors are used exclusively in the types IM B34 and IM B14. The type is indicated according to Code I, DIN EN 60034-7 on the rating plate.

IM B34: Shaft horizontal, feet on floor

IM B14: Shaft horizontal, no feet

### Rated voltage, frequency and power output

The motors are configured as standard for a rated motor voltage in accordance with IEC 38 of 230 V, 400 V or 690 V for 50 Hz networks (standard winding). Motors for other voltages and frequencies (non-standard winding) are available at additional cost.

The voltage deviation permitted in operation for the aforementioned rated motor voltages and for special voltages is  $\pm 5\%$  for range A (continuous duty operation) and  $\pm 10\%$  for range B (short-time duty operation), as specified in EN 60034-1. The permitted frequency deviation is  $\pm 2\%$  for range A and  $-5/+3\%$  for range B. For supply voltages that are 95% or 105% of the rated motor voltage, the tolerances described in EN 60034-1 are met. Furthermore, motor temperature is allowed to exceed the permitted temperature rise limit by 10 K. The percentile specifications for the permitted voltage and frequency deviations are not stamped onto the rating plate of the motor. The presence of the CE mark on the motor rating plate, accompanied by a reference to standard EN 60034, guarantees that these requirements have been incorporated by the motor manufacturer during configuration of the motor.

Motors for a rated motor voltage in accordance with DIN IEC 38 of 230 V and 400 V for 50 Hz networks (standard winding) and with power outputs of  $< 0.75\text{ kW}$  are configured for the wide voltage range for 50 and 60 Hz networks. Within this wide voltage range, the motors may be used as continuous running duty type S1. EN 60034-1 also holds for the guideline values of the voltage range in respect of permitted voltage and frequency deviations for ranges A and B. The wide voltage range is indicated on the motor rating plate.

Indication of wide voltage range:

50 Hz: 400 V  $\pm 5\%$  or  
220 – 240 V / 380 – 420 V  
60 Hz: 460 V  $\pm 5\%$  or  
254 – 280 V / 440 – 480 V

Use of the wide voltage range in the case of motors with power outputs  $< 0.75\text{ kW}$  is permitted because these motors do not come under Directive 2005/32/EC (Energy Using Products) and are not therefore required to comply with Commission Regulation (EC) No 640/2009 in terms of meeting the IE3 efficiency level. For this reason, the rating plates of these motors do not carry the IE3 mark. Motors for special voltages with power outputs  $< 0.75\text{ kW}$  contain non-standard windings optimised for a single voltage/frequency point (such motors are also referred to as tailor-made motors). Special voltages for 50 and 60 Hz networks are available at additional cost and should be specified at the time of order. Motors with performance  $\geq 0.75\text{ kW}$  are optimized for one voltage/frequency point and are designed solely on a tailor-made basis. They are configured as standard for a rated motor voltage in accordance with IEC 38 of 230 V, 400 V or 690 V for 50 Hz networks (standard winding). They meet the IE3 efficiency level as set out in Directive 2005/32/EC (Energy Using Products) and Commission Regulation (EC) No 640/2009. The rating plates of these motors carry the IE3 mark. Motors for special voltages with power outputs  $\geq 0.75\text{ kW}$  contain non-standard windings optimised for a single voltage/frequency point. Special voltages for 50 and 60 Hz networks for all rated motor voltages in general use throughout the world are available and should be specified at the time of order. The stated rated outputs and operating values apply to duty type S1 in accordance with EN 60034-1 at the stated rated frequency, rated voltage, a coolant temperature of 40°C maximum and a site installation altitude up to 1 000 metres above sea level. Enquiries for motors for operating conditions other than those mentioned are welcome, on the understanding that these will incur additional costs.

# IEC squirrel cage motors

## Fundamentals

### Circuit

The phase belts of the motor that are laid on the terminal board can be interconnected in two different connection systems:

#### Star connection

In the star connection, the coil ends U2, V2, and W2 are interconnected on the terminal board, creating the neutral point. Mains

power is connected on the free connection ports of the coil ends U1, V1, and W1 on the terminal board.

#### Delta connection

In the delta connection, the end of the phase belt is interconnected with the beginning of the next phase belt. (U2 to V1, V2 to W1, W2 to U1). Mains power is connected at the connection points on the terminal board.

<sup>1)</sup> In the UL/CSA design, the motor is also supplied with a rating place for CE.

### Cooling method

The motors are designed for cooling method IC 411 (surface cooling).

### Temperature class

The insulation on the motor coils is designed for temperature class 155 (F). When utilized at their performance rating, the motors meet temperature class 130 (B). Given a coolant temperature of 40°C, the power reserve is thus approx. +10%; when operated at their performance rating, the temperature reserve is approx. +20 K.

### Terminal box

The terminal boxes have a protection class of IP55. The terminal box of the standard motor is positioned on the right when viewed from the drive side. An exception is 2-pole motors of size 112 (4.0 kW), in which the terminal box is installed on the top for design reasons. Special motors with other terminal box positioned as standard motor are available on request.

The position of the openings for cable entry can be adjusted to the available connections by turning the terminal box by 90° each time (terminal box design 95x95 mm). Terminal boxes with dimensions 120x115 mm can only be turned by 180°. The thread on the cable inlets have a metric thread of 1x M20x1.5 for frame sizes 63 to 90.

Frame size 100 and 112 have a metric thread of 2x M25x1.5 and frame size 132 have 2x M32x1.5. The terminal board has a 6-pole design.

### Protection class

The motors are designed for protection class IP55 according to DIN EN 60034-5.

#### Touch and foreign object protection:

Provides complete protection against contacting or getting close to such parts, as well as against touching moving parts within the housing. Provides protection against the ingress of damaging amounts of dust deposits. Water protection: A jet of water from a nozzle and aimed at the motor from all directions has no adverse effect.

1) Flange with threaded hole acc. to DIN EN 50347 (FT).

2) Beyond a performance rating of 0.75 kW, the motors come with tailor-made coils. Wide voltage range motors only for performance ratings < 0.75 kW.

3) Beyond a performance rating of 0.75 kW, the motors are designed for efficiency class IE3.

1) Mounting flange acc. to DIN EN 50347.

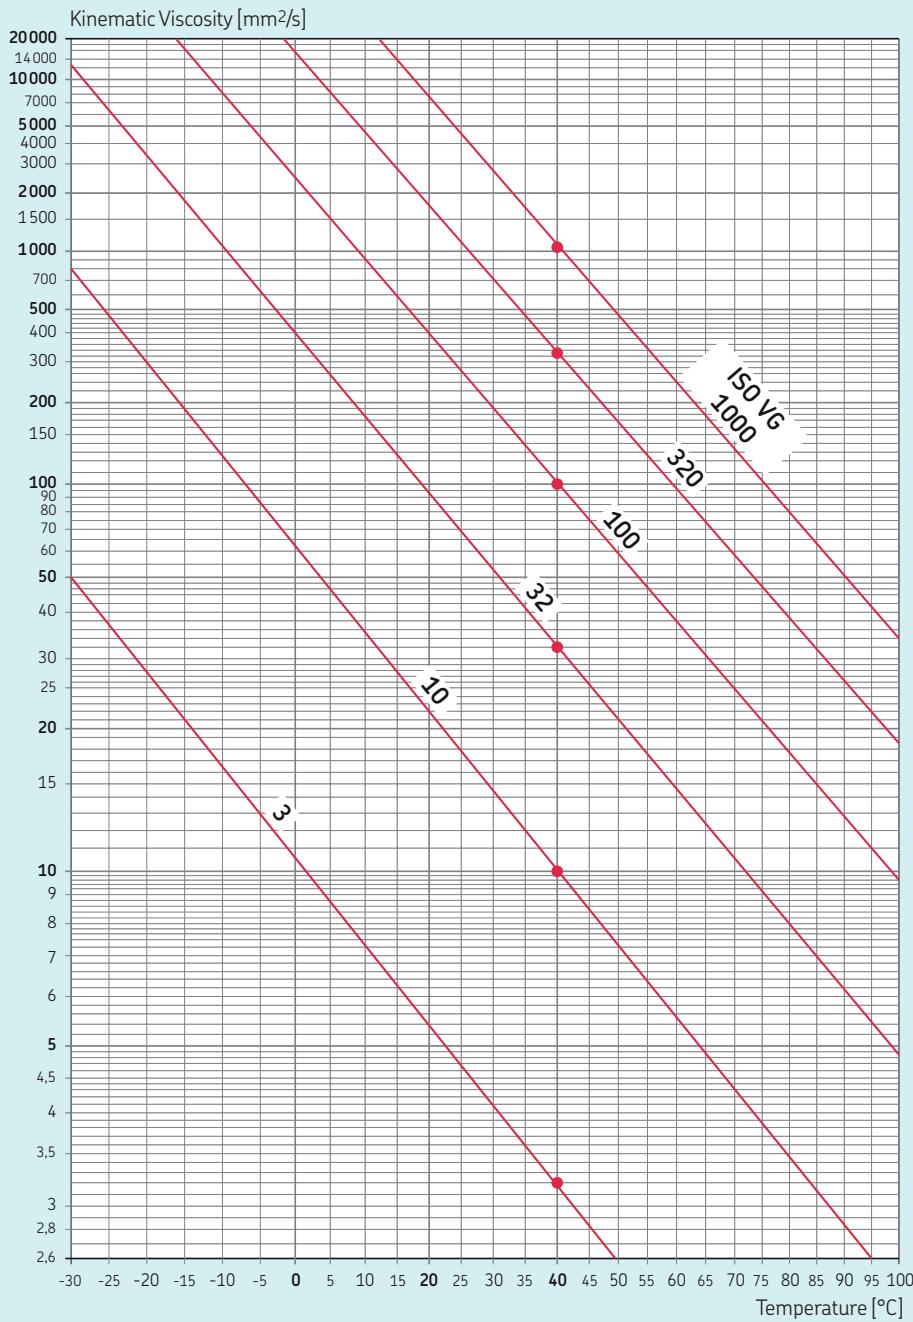

2) Only standard terminal box position on top is supported, right is not possible.

For motor data → page 17.

# Viscosity-temperature relationship of oils with different rated viscosity

Diagramm 5

## Viscosity-temperature relationship of oils

The curves are based on a viscosity index of VI ~ 95, approximately corresponding to standard mineral oil. The viscosity index describes the slope of the curve and thus the viscosity-temperature relationship at temperatures other than +40 °C.

The lines appear straight because a logarithmic scale was selected for the ordinates so that the slope of the curves can be determined easily based on 2 measuring points.

## Viscosity class \*

ISO VG is approx.

3,10	Spindle oils
32,100	Normal machine oils
320	Medium-heavy machine oils
1000	Gear oil or similar

\* The values correspond to the midpoint viscosity at 40 °C in mm²/s

### Note

The change in the viscosity of oils is disproportionately greater in lower temperature ranges than in higher temperature ranges. For example, an oil with a rated viscosity of 100 undergoes the following viscosity change in different temperature ranges at the same temperature difference:

at +80 °C = 18 mm²/s

at +75 °C = 21 mm²/s  
change of 3 mm²/s

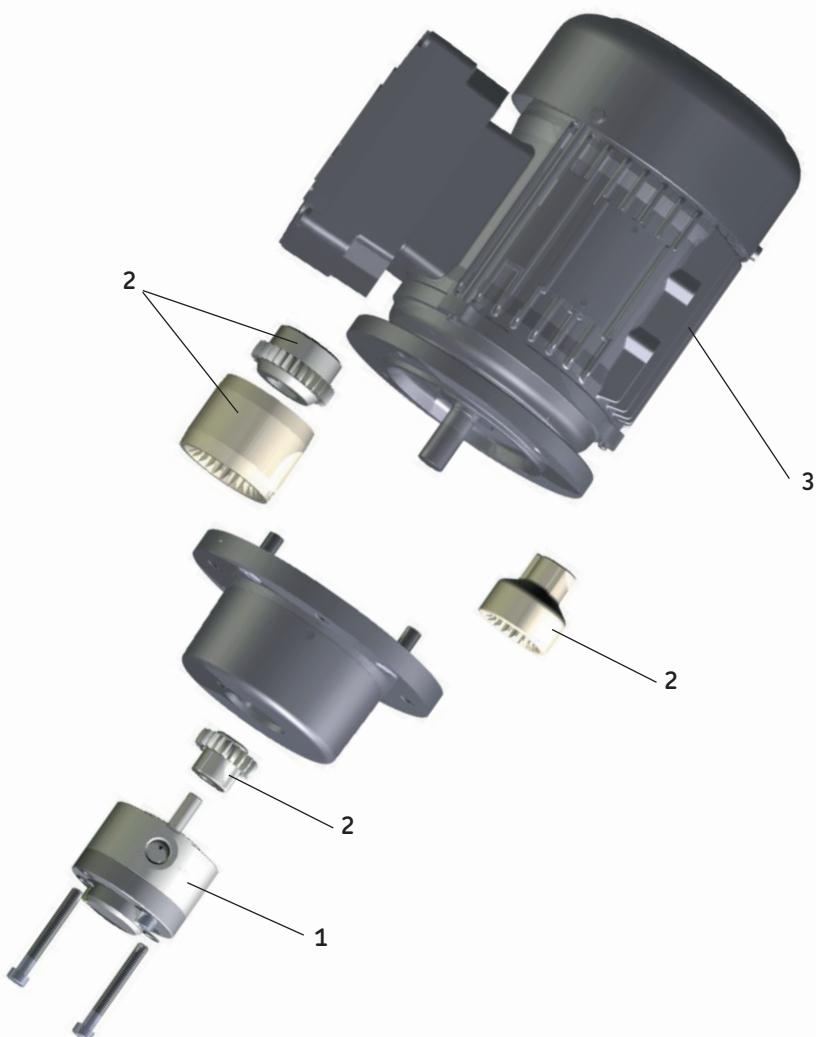

at +10 °C = 875 mm²/s  
versus

at + 5 °C = 1450 mm²/s  
change of 575 mm²/s

1) supplement the order No. with the code letter for the desired seal. Design NBR (N) or FKM (F).

2) it is recommended that coupling parts always be replaced completely.

# Gerotor pump, product series 143

## Comparison of order numbers

Table 10

Comparison of old and new order Nos. for gerotor pump, product series 143

Nominal delivery rate l/min	Back pressure max. bar	Permiss. viscosity range mm <sup>2</sup> /s	Sealing design NBR		Sealing design FKM	
			Old order No.	New order No.	Old order No.	New order No.
0.85	30	20–1000	143-011-131	143-14NB03	143-011-132	143-14FB03

**!** **Important information on product usage**

SKF and Lincoln lubrication systems or their components are not approved for use with gases, liquefied gases, pressurized gases in solution and fluids with a vapor pressure exceeding normal atmospheric pressure (1 013 mbar) by more than 0,5 bar at their maximum permissible temperature.
