

HOME OF CLAMPING

2023/2024
HYDRAULIC CLAMPING SYSTEMS

WE GENERATE EXCITEMENT.

Since the foundation of the company in 1890 until today the goal has remained the same: the highest quality in products and services. Nevertheless, the circumstances, tasks and challenges have changed, of course. By focussing on our core areas of expertise, we have long set new standards for innovative clamping technology - driven by our own development, the greatest possible flexibility and passion for individual solutions.

All this is only possible with committed and contented employees. Respectful interaction with others, personal development and measures for the wellbeing of each individual are therefore values that matter to us.

Company Management:
Wolfgang Balle, Johannes Maier (CEO), Jürgen Förster

OUR COMPANY HISTORY

- 1890 Company founded as a lock manufacturer by Andreas Maier.
- 1920 Product range extended to include spanners.
- 1928 Production line assembly of FELLBACH LOCKS.
- 1951 Introduces clamping elements and diversifies into workpiece and tool clamping technology.
- 1965 Toggle clamps extend the AMF product range, AMF catalogues are now printed in ten languages.
- 1975 Further specialisation into hydraulic clamping technology.
- 1982 Clamping and fixture systems round off AMF's clamping expertise.
- 1996 AMF team organisation in all sectors of the business, Quality management with certification to ISO 9001.
- 2001 AMF Service Guarantee for all products.
- 2004 Introduction of the ZPS zero-point clamping system.
- 2007 The magnetic clamping technology extends the AMF product range.
- 2009 Development and marketing of AMF Vacuum clamping technology.
- 2012 LOW-COST AUTOMATION gripping, clamping, marking and cleaning.
- 2014 AMF presents the most extensive product range of automation solution in zero-point clamping technology.
- 2017 Wireless sensing systems extend the expertise into Industry 4.0 and blends seamlessly into the AMF product range.

PLEDGES THAT COUNT IN EVERYDAY LIFE

For this reason, we have a few principles that we follow by conviction and which always apply..

INDIVIDUAL DEVELOPMENT

Even if the product you need does not even exist yet, we will find the right solution with you: from special designs to new developments, everything is possible.

WARRANTY

If, despite our high quality standard, there is a complaint, this is dealt with quickly and unbureaucratically, even beyond the warranty period.

HIGHEST QUALITY STANDARDS

Careful manufacturing based on tradition since 1890, and naturally with a modern quality management system according to ISO 9001 for many years.

SHORT DELIVERY TIME

With over 5,000 articles in our warehouse, you can expect your order to be dispatched on the same day.

COMPETENT SERVICE FROM EXPERTS

Your local retail partner or the specialists in our team will find the right solution for every task.

MADE IN GERMANY

Our entire product range is developed and manufactured exclusively by our employees in Germany.

RECOMMENDATIONS AND PARAMETERS OF OIL-HYDRAULIC DEVICES AND PLANTS.

GENERAL:

All parameters are published in accordance with the DIN regulations.

OIL RECOMMENDATION:

Oil temperature (°C)	designation to DIN 51 524	viscosity to DIN ISO 3448
0-40	HL, HLP 22 or HLPD 22	ISO VG 22
10-50	HL, HLP 32 or HLPD 32	ISO VG 32

CLAMPING ELEMENTS:

Pressure range:

At continuous pressures below 80 bar, this must be stated on ordering as a different seal combination may need to be selected.

Ambient temperature:

-10°C to +60°C

Thermal expansion:

If thermal expansion is prevented in a hydraulic system, the pressure rises by about 10 bar per 1 °C temperature increase. Such conditions require overpressure protection.

Seals:

- > O-rings made of NBR or PU
- > Supporting rings made of PTFE
- > Flange seals made of PTFE, NBR, PU or Cu
- > Glydring made of PTFE or PU
- > Scraper ring made of PU or NBR

At higher ambient temperatures, clamping elements have to be equipped with heat-resistant seals (Viton® or similar). These are available upon request.

Mounting position:

As desired, unless otherwise specified.

Piston radial force:

The piston radial force must never exceed 5% of the nominal cylinder force.

Stroke speed:

0.01 – 0.5 m/s (for swing clamps, always observe the specifications!).

Leakage rate:

Dynamic = up to 32 mm piston dia.:
 < 0.3 cm³ per 1000 double strokes and 10 mm stroke (HLP 22)
 from 40 mm piston dia.:
 < 0.6 cm³ per 1000 double strokes and 10 mm stroke (HLP 22)
 Static = no leakage rate

FOR YOUR SAFETY:

To avoid injuries, a maximum distance of 4 mm (in accordance with DIN EN ISO 13857, part 1) between workpiece and clamping element must not be exceeded.

To ensure safe clamping, clamping elements must be positioned in such a way that a residual stroke remains in the clamping cylinder after clamping.

HOSE CONNECTIONS:

When using high-pressure hoses, the following must be observed:

- > maximum operating pressure
- > bending radius
- > tightening torque of cap nut
- > dynamic or static use
- > environmental influences
- > the date for the permissible duration of use

PIPES:

Seamless steel pipe, phosphatised and oiled, dia. 8x2 mm, in accordance with DIN EN 10305. Pipes must be kept as short as possible, especially when used with single-action cylinders. Pipe bends must be made to the largest possible radius.

CONNECTING THREADS:

Whitworth pipe thread, X-type threaded bore in accordance with DIN 3852, page 2. Seal by means of sealing edge. Do not use Teflon tape or additional sealing compound.

STATIC PRESSURE IN HYDRAULIC SYSTEM:

Cylinders, valves or lines and couplings create internal friction. An oil pressure of approx. 2 bar is required to overcome this static pressure. For single-acting cylinders with return springs, the static pressure must be reduced by keeping the supply line as short as possible and using piston rods with the smallest possible mass. Max. permissible back pressure for unclamping must not be exceeded. The counter-pressure in the return flow should not exceed 0.5 bar.

For double-acting elements, static pressures increases when load is applied to the rod side. Parts of the relatively large oil volume on the piston side cannot drain quickly enough. Static pressure does usually not affect the clamping elements.

COMMISSIONING AND MAINTENANCE:

- > Use only clean hydraulic oil of the specified type.
- > Observe all instructions and information provided in mounting instructions before commissioning!
- > Vent the hydraulic system at low operating pressure at the highest point until the fluid is free of bubbles.

Hydraulic directional valves are very sensitive to soiling and contamination. Contamination and soiling of the pressure medium must be avoided. An oil change every six months is recommended. The oil level in the pressure generator must be checked regularly.

HYDRAULIC PARAMETERS, UNITS AND FORMULA SYMBOLS:

The units used in this catalogue for physical quantities are in accordance with DIN 1301.

Symbol	Unit	Description	Unit	Conversion
F	N	Force	Newton	1 N ≈ 0,1 kp 1 kN ≈ 100 kp
p	bar Pa	Pressure	bar Pascal	1 bar = 10 N/cm ² ≈ 1 atm. = 10 ⁵ N/m ² 1 Pa = 1 N/m ²
A	cm ²	Effective piston area	-	1 m ² = 10 ⁴ cm ²
V	cm ³	Volume	-	1 dm ³ = 1000 cm ³ = 1l (Liter)
t	s	Time	second	-
Q	$\frac{l}{min}$	Oil-flow rate	-	$1 \frac{l}{min} = 16,67 \frac{cm^3}{s}$

TECHNICAL EQUATIONS:

Clamping force: $F (N) = 10 \times A (cm^2) \times p (bar)$

Required operating pressure: $p (bar) = \frac{0,1 \times F (N)}{A (cm^2)}$

Oil volume per cylinder: $V (cm^3) = 0,1 \times A (cm^2) \times \text{stroke (mm)}$

Clamping time: $t (s) = 1 + \frac{A (cm^2) \times \text{stroke (mm)} \times n (\text{no's of cyl.})}{Q (l/min.) \times 167}$

CLAMPING FORCE OF BOLTS:

For hydraulic clamping, the fatigue strength of the bolts is considered to obtain a high number of strokes. The testing force or yield strength must only be utilized for low numbers of strokes.

Clamping bolts					Hydraulic cylinders									
Thread	Pitch [mm]	Nominal cross-section As [mm ²]	Testing force for bolt grade 8.8 [kN]	Permissible load for continuous operation [kN]	Nominal cylinder size									
					2	5	8	12	20	32	50	70	125	
M 6	1,00	20,1	11,6	4,3										
M 8	1,25	36,6	21,2	8,0										
M 10	1,50	58,0	33,7	12,5										
M 12	1,75	84,3	48,9	18,3										
M 14	2,00	115,0	66,7	25,0										
M 16	2,00	157,0	91,0	34,0										
M 18	2,50	192,0	115,0	43,0										
M 20	2,50	245,0	147,0	55,0										
M 24	3,00	253,0	212,0	79,5										
M 27	3,00	459,0	275,0	103,0										
M 30	3,50	561,0	337,0	126,0										

NOMINAL CYLINDER SIZES:

The nominal cylinder sizes are intended to facilitate cylinder selection: These sizes correspond to the clamping force in kN, related to the maximum operating pressure in each case (usually 400 bar) and the effective piston area.

Nominal cylinder size	Piston dia. [mm]	Piston area [cm ²]	Clamping force F en kN				
			100 bar	250 bar	350 bar	400 bar	500 bar
2,0	8,0	0,5	0,50	1,25	1,75	2,0	2,5
2,4	9,0	0,7	0,68	1,70	2,40	-	-
4,4	12,5	1,3	1,25	3,10	4,40	-	-
5,0	12,0	1,1	1,10	2,80	3,80	4,4	5,5

No. 6901

Screw Pump

block version and built-in version,
max. operating pressure 350 bar.

Order no.	Article no.	max. operating pressure [bar]	stroke volume per rev. [cm ³]	stroke volume total [cm ³]	Md max. [Nm]	Weight [g]
67819	6901-10	350	2,1	26	50	1524
67835	6901-20	350	2,1	26	50	689

Design:

Housing from steel, hardened and burnished. Threaded spindle hardened and burnished. Screw pump no. 6901-20 is supplied with 2 grooved nuts. Oil supply via threaded port.

Application:

The screw pump is particularly suitable to operate small clamping fixtures.

Note:

For an enclosed circuit the following has to be considered: The hydraulic clamping elements connected to the screw pump have to be hermetically tight. Due to possible leakage of the clamping cylinders during stroke movement and the compressibility of oil (1% at 140 bar), the stroke volume of the screw pump shall be used up to 70% only. The compressibility is being increased considerably by air content in the oil. Therefore the hydraulic system has to be carefully purged of air. An air bled screw at the highest position is a necessity. After returning the spindle of the pump, oil must be refilled at this spot. No air pocket should arise in the hydraulic system, which cannot be purged. A precise pressure control is possible by a manometer only. An electric pressure switch enables a pressure monitoring too. A pressure limiting valve is not suitable. Operating the threaded spindle by a torque wrench is possible. However the pressure should also be checked by a gauge. For the built-in version the mounting torque has to be observed.

6901-10

6901-20

Clamping pressure in relation to torque:

No. 6902

Hand Pump

max. operating pressure 1st stage 50 bar,
max. operating pressure 2nd stage 700 bar.

Order no.	Article no.	Displacement per stroke 1st stage [cm ³]	Displacement per stroke 2nd stage [cm ³]	Q usable [cm ³]	max. hand lever force [N]	A	B	Weight [Kg]
61937	6902-7	20	1	300	350	320	275	6,0
61945	6902-8	20	2	1000	320	620	575	8,1

Design:

Lightweight two-speed hand-pump. Low hand force required at max. operating pressure. Pump housing from malleable cast iron, oil reservoir from aluminium. With pressure relief valve, factory set at max. pressure of 700 bar. Hand pump complete with oil fill. Oil supply via threaded port.

Application:

Typical applications for the hand-pump are e.g. small clamping fixtures with irregular use, testing fixtures or for repair jobs. Please note, in case of a pressure drop the hand-pump is not capable of automatically maintaining system pressure.

Note:

Can be operated in horizontal position or vertical position with head facing downwards. Before putting in to operation open combined reservoir vent-and-relief cap. Care for proper air bleeding of connected hydraulic components. Special pumps for different fluids and pressure ratings are available upon request.

Hydraulic diagram:

No. 6903

Hydraulic intensifier

Temperature -40 - +120°C

Order no.	Article no.	Ratio i	max. operating pressure ND [bar]	max. operating pressure HD [bar]	Q max. ND [l/min]	Q max. HD [l/min]	Weight [g]
452060	6903-20-15	1,5	200	300	8	1,0	1000
320184	6903-20-20	2,0	200	400	12	2,0	1000
275198	6903-20-32	3,2	200	640	15	2,5	1000
320192	6903-20-40	4,0	200	800	14	2,0	1000
291526	6903-20-50	5,0	160	800	14	1,6	1000
320200	6903-20-66	6,6	120	800	13	1,3	1000

ND = low pressure side, HD = high pressure side

Design:

Steel housing galvanized and chrome plated, piston and valve seat from steel. Oil supply via threaded port.

Application:

Hydraulic intensifier are used to pressurise hydraulic clamping fixtures and assembly devices. The low pressure of the tooling machine's hydraulic system will be converted into a higher operating pressure according to the ratio. Input pressure and output pressure are proportional. The output pressure can be adjusted by the input pressure.

Features:

The most important functions are shown in the hydraulic circuit diagram. Oil is guided through directional valve CV to input IN and flows unimpeded through check valves KV1, KV2 and DV and into high pressure area H.

In these conditions the pressure intensifier achieves a maximum flow rate with rapid forwards motion. Once input pressure IN is achieved in high-pressure area H, valves KV1, KV2 and DV close. The output pressure is built up by oscillating pump unit OP. The unit switches itself off automatically when the output pressure is achieved in high-pressure area H. In case of pressure loss in the high-pressure area due to consumption or loss of oil, pump unit OP starts automatically in order to maintain the output pressure.

Pressure can be relieved from the high pressure area via the directly controlled valve DV.

Note:

The hydraulic oil must be filtered with mesh size not larger than nominally 10 µm, 19/16 according ISO 4406. If the intensifier will be used for applications where the oil supply is disengaged, a leakage free pilot controlled check valve should be installed between high pressure output H and the cylinder. Please consider the min. control pressure for releasing. The design of the intensifier allows a certain leakage between the ports IN and R. This has to be considered in uncoupled operations.

On request:

Manifold mounting and other sizes available on request.

Hydraulic diagram:

No. 6903

Hydraulic pressure booster

For O-ring connection,
max. operating pressure in outlet 500 bar,
min. operating pressure in inlet 20 bar

Hydraulic diagram:

Hole pattern shape A nominal size 6:

Application examples:

Order no.	Article no.	NG	Rato i	max. operating pressure ND [bar]	max. operating pressure HD [bar]	Q max. ND [l/min]	Q max. HD [l/min]	Weight [g]
328682	6903-30-15	6	1,5	200	300	8	1,0	2360
328708	6903-30-20	6	2,0	200	400	12	2,0	2360
328807	6903-30-28	6	2,8	178	500	15	2,2	2360
328727	6903-30-32	6	3,2	150	500	15	2,5	2360
328740	6903-30-40	6	4,0	125	500	14	2,0	2360
328765	6903-30-50	6	5,0	100	500	14	1,6	2360
328781	6903-30-66	6	6,6	75	500	13	1,3	2360

Design:

Steel housing galvanized and chrome plated, piston and valve seat from steel. Oil supply via oil channel in fixture body.

Application:

Hydraulic pressure boosters are used in clamping fixtures and assembly fixtures. The low pressure of the tooling machine's hydraulic system is converted into a higher operating pressure according to the transmission ratio. Input pressure and output pressure are proportional. The output pressure can be adjusted by the input pressure.

Features:

The most important functions are shown in the hydraulic circuit diagram. Oil is routed via the directional control valve to the IN connection and then then flows unhindered through non-return valves KV1 and KV2, as well as through non-return valve DV in the high-pressure range A. Under these conditions, a maximum flow through the pressure booster is achieved and a fast forward movement is generated. If input pressure IN is reached in the high-pressure area, valves KV1, KV2 and PV close. The output pressure is built up by oscillating pump unit OP. The unit switches off automatically when the final pressure has been reached in the high-pressure area A. In case of a pressure drop in the high-pressure area due to oil consumption or oil loss, pump unit OP will start automatically in order to maintain the final pressure. The pressure in the high-pressure area can be relieved via the the directly actuated pressure valve.

Note:

The hydraulic oil is to be filtered to a max. nominal filter mesh of 10 µm, max. 19/16 to ISO 4406. When installing in systems in which the supply is decoupled from the pressure booster, a leak oil-free, releasable non-return valve should be installed on the high-pressure side. It must be noted that the pilot ratio of the valve must be greater than the transmission ratio of the pressure booster. The structure of the pressure booster permits a certain leakage between the IN and R connections, which must be taken into account in decoupled installations.

Subject to technical alterations.

No. 6904-20

Air-Hydraulic Pump

max. operating pressure 500 bar.

Order no.	Article no.	Pneum. pressure min. [bar]	Pneum. pressure max. [bar]	Oil capacity usable horizontal [l]	Oil capacity usable vertical [l]	Q max. [cm ³ /min]	Weight [Kg]
69435	6904-20	2,8	10,0	2,1	1,5	1400	6,3

Design:

Compact compressed air operated hydraulic pump for single acting circuits. Robust plastic tank. The motor is protected against contamination by an air filter at the inlet and an internal oil filter. Safety valve to prevent overpressure and sound absorbers are fitted. Oil supply via threaded port.

Application:

The air-hydraulic pump can be used for small hydraulic clamping and assembly equipment. The air-hydraulic pump is designed for single acting cylinders.

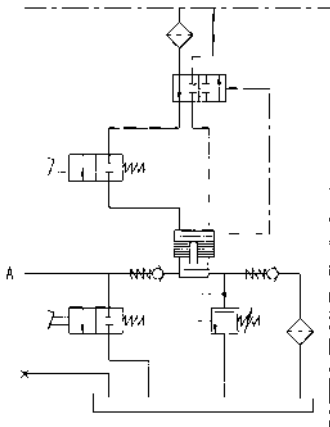

Features:

The large air/oil intensification ratio allows for high hydraulic pressures even with small air pressure. Low weight allows for mobile application. The pump can be mounted horizontally or vertically.

Note:

Optionally, pumps with other operating pressures are available upon request. Please observe proper venting of the single acting system. All tolerances other than specified refer to DINISO 2768 mittel (medium).

Air-Hydraulic Pump

max. operating pressure 500 bar.

Order no.	Article no.	Pneum. pressure min. [bar]	Pneum. pressure max. [bar]	Oil capacity usable horizontal [l]	Oil capacity usable vertical [l]	Q max. [cm ³ /min]	Weight [Kg]
69450	6904-25	2,8	10,0	2,1	1,5	1400	6,3

Design:

Compact compressed air operated hydraulic pump for double acting circuits. Robust plastic tank. The motor is protected against contamination by an air filter at the inlet and an internal oil filter. Safety valve to prevent overpressure and sound absorbers are fitted. Oil supply via threaded port.

Application:

The air-hydraulic pump can be used as drive element for small hydraulic and assembly equipment. Safety is guaranteed by automatic pressure compensation. The air-hydraulic pump is designed for the assembly of valves with connection diagram CETOP 03, i.e. with the option to control single or double acting cylinders. The changeover can be made manually, pneumatically or electrically.

Features:

The large air/oil intensification ratio allows for high hydraulic pressures even with small air pressure. Low weight allows for mobile application. The pump can be mounted horizontally or vertically.

Note:

Optionally, pumps with other operating pressures are available upon request. Please observe proper venting of the single acting system. All tolerances other than specified refer to DINISO 2768 mittel (medium).

327650	6906-62660	2	2,5	4/3	-	-	-	56
327676	6906-62661	2	2,5	4/3	6906B-3-2	●	-	64

Design:

Compact, plug-in pump unit, ready for electric and hydraulic operation. Complete with: pressure limiting valve and pressure switch, solenoid valve, pressure gauge, float switch with temperature monitoring, oil fill, electrical control with main switch, indicator lamps and flange sockets. Electrical connection, complete with CEKON connector, pressure filter with filter mesh of 25µm. Oil supply via threaded port.

Application:

These pump units are mainly used as drive and control elements for single- and double-acting clamping devices.

Operation type:

Control panel for one and two clamping circuits. Two-hand control panel for only one clamping circuit.

Features:

The radial piston pump is driven via an alternating current standard motor with the energy efficiency class IE3. The motor is protected against overload by a motor protection switch and a thermoelement. Pressure setting and pressure monitoring are accomplished via a pressure limiting valve (DBV) and an electronic pressure switch (EDS). The value set at the pressure limiting valve is stored with the Mode button on the pressure switch. This simultaneously sets the preprogrammed switch-off and switch-back point.

- High safety standard through the use of 4/3-way seat valves!
 - No unwanted traversing movements. In the event of a loss of power or contact problems, the valve returns to the hermetically sealed centre position.
 - Easy activation of external machine controllers (e.g. PLC).
- The pump unit works in intermittent mode. In the event of a loss of pressure, the pump is subsequently automatically switched by the pressure switch. In the event of a lack of oil or an increase in oil temperature, the built-in floating switch with temperature monitoring switches the pump off and the fault lamp on the electrical controller lights up.

Note:

Ensure that the ventilation is working properly when connecting the elements. In the event of a loss of pressure, subsequent pumping must not exceed a maximum of 2 times per minute. The pump unit must not be allowed to run continuously.

Options:

Clamping circuits: For up to 5 clamping circuits, there is an electrical controller. For more than 5 clamping circuits, there is no electrical controller.
Valve combination: Pressure reduction and clamping pressure monitoring in certain clamping circuits. Pressure reduction for all subsequent clamping circuits. Pressure filter with filter mesh 10µm or 40 µm. Throttle valves for specified clamping circuits.

On request:

Directional valves with other function diagrams on request.
Three to five clamping circuits on request.

Hydraulic diagrams:

Energizing both valve magnets creates a switching position that links all 4 connections to each other. A depressurised state is created that allows easy coupling.

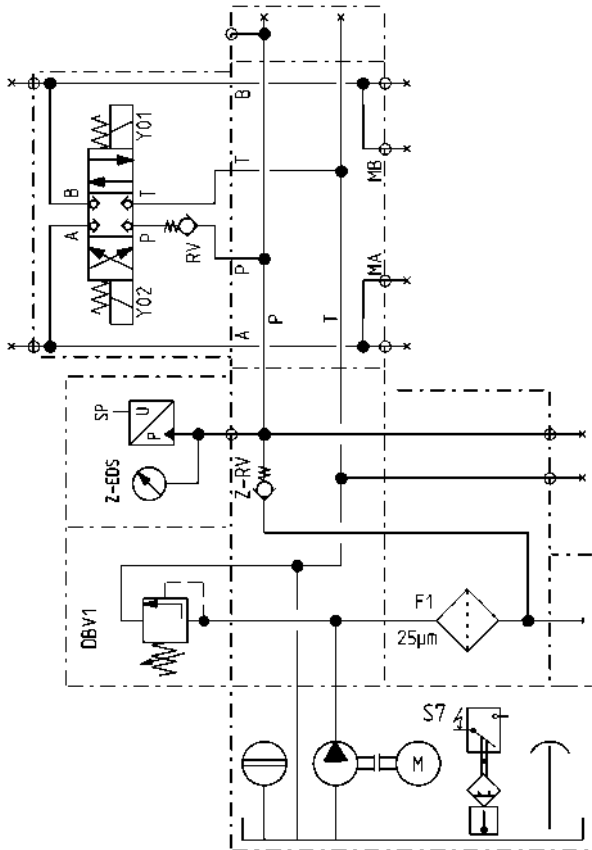

4/3-directional seat valve for single and double-acting consumers

328955	6906N-61616	1	2,5	4/3	6906B-2-1	●	400	61

Design:

Compact, plug-in energy-saving pump unit, ready for electric and hydraulic operation. Complete with: pressure limiting valve and pressure switch, solenoid valve, pressure gauge, float switch with temperature monitoring, oil fill, electrical control with main switch, indicator lamps and flange sockets. Electrical connection, complete with CEKON connector, pressure filter with filter mesh of 25µm. Oil supply via threaded port.

Application:

This pump unit is used predominantly as a drive and control element for single and double-acting clamping fixtures.

Control method:

For connection of 1-circuit control console no. 6906B-2-1 order no. 324723

Features:

The radial piston pump is driven via an alternating current standard motor with the energy efficiency class IE3. The motor is protected against overload by a motor protection switch and a thermoelement. The pressure is set via a pressure limiting valve (PLV) and centralised electronic pressure switch (EPS). The pressure is set via the electronic pressure switch (EPS) in the A and B channel. They sit directly in the directional control valve. These EPS control the directional control valve in the working or zero position and output signals for switching the pump motor on and off.

- Reduced power consumption and lower temperature rise
- No heat influence on the oil column in the distributors and loads
- No hazard to components due to excessive rise in pressure
- No risk of injury from hand contact
- No drop in magnetic force
- Prolonged service life of the magnets

The pump unit works in intermittent mode. If pressure drops in the A- or B-channel, the pump is automatically switched on afterward by the electronic pressure switch EDS. In case of low oil level or an increase in oil temperature, the built-in floating switch with temperature monitoring switches the pump off and the fault lamp on the electrical controller comes on.

Note:

Ensure correct bleeding when connecting elements. In the event of a loss of pressure, subsequent pumping must not exceed a maximum of 2 times per minute. The pump unit must not run continuously.

On request:

Two, three and four clamping circuits on request.

Hydraulic diagrams:

Energizing both valve magnets creates a switching position that links all 4 connections to each other. A depressurised state is created that allows easy coupling.

4/3-directional seat valve for double-acting consumers

No. 6906

Pump unit

with pressure-control device (DSG),
single- and double-acting,
max. operating pressure 400 bar.

Order no.	Article no.	Clamping circuits	Q [l/min]	Valve type	Matching control unit	Electric control	Pressure switch	Weight [Kg]

326058	6906-62621	2	2,5	4/3	6906B-3-2	●	-	64

Design:

Compact, plug-in pump unit, ready for electric and hydraulic operation. Complete with: Pressure-control device, solenoid valve, pressure gauge, floating switch with temperature monitoring, oil filling, electrical control with main switch, indicator lamps and flange sockets. Electrical connection, complete with CEKON connector, pressure filter with filter mesh of 25µm. Oil supply via threaded port.

Application:

These pump units are mainly used as drive and control elements for single- and double-acting clamping devices.

Operation type:

Control panel for one and two clamping circuits. Two-hand control panel for only one clamping circuit.

Features:

The radial piston pump is driven via an alternating current standard motor to energy efficiency class IE3. The motor is protected against overload by a motor protection switch and a thermocouple. Pressure setting and pressure monitoring are made via a pressure control device. The pressure control device combines the pressure limiting valve (PLV) and the pressure switch (PS) in a single device. The pressure is continuously adjustable over the entire pressure range by means of an adjustment sleeve. The point for restarting is about 10-15% below the switch-off point.

- High safety standard through the use of 4/3-directional seat valves!
- No unwanted travel movements. In the event of a loss of power or contact problems, the valve returns to the hermetically sealed centre position.
- Easy actuation by external machine controllers (e.g. PLC).

The pump unit works intermittently. In the event of a loss of pressure, the pump is subsequently automatically switched by the pressure control device. In case of low oil level or an increase in oil temperature, the built-in floating switch with temperature monitoring switches the pump off and the fault lamp on the electrical controller comes on.

Note:

Ensure that the ventilation is working properly when connecting the elements. In the event of a loss of pressure, subsequent pumping must not exceed a maximum of 2 times per minute. The pump unit must not be allowed to run continuously.

Options:

Clamping circuits: For up to 5 clamping circuits, there is an electrical controller. For more than 5 clamping circuits, there is no electrical controller.

No. 6906B-3-2

2-circuit remote control (rotary switch)

6906B-2-1

6906B-3-2

Order no.	Article no.	Control voltage	Number of poles	Cable length	Weight
				[m]	[g]
324723	6906B-2-1	24 V =	24	5	1660
323394	6906B-3-2	24 V =	24	5	1660

Design:

Compact polyester housing with control elements, cable and coupling plug. Protection class IP65.

Application:

The control panel has a selector switch „coupling-clamping-0-unclamping-coupling“ for each clamping circuit, and a black STOP mushroom push button for stopping the pump and valves. During clamping and unclamping the corresponding valve is switched. In switch position 0, the valve is spring loaded and returns to the zero position (mostly locked zero position). In the coupling position both magnets are switched at the same time. The pump is switched off. In addition, the „Operation“ indicator lights on the unit go out and the readiness for external machine enabling is switched off. In external machine enabling, the signal „ready for operation“ and one pressure switch on each of the clamping points to be monitored should be integrated.

No. 6906BZH-2

Two-hand safety operator panel

Order no.	Article no.	Control voltage	Cable length	Weight
			[m]	[g]
324426	6906BZH-2	24 V =	5	4840

Design:

Compact cast aluminium housing with control elements, cable and coupling plug.

Application:

The two-handed safety operating panel may be used only in combination with the pump units from Andreas Maier GmbH & Co. KG. It is suitable for the units with the following order numbers: 327635, 325969 or 326041.

The two-handed safety operating panel controls fixtures (cylinders, etc.) on which hazardous extension and retraction movements (strokes ≥ 4 mm) can occur.

The following fluidic system requirements must be met for the operating panel function:

- 4/3-way valve with hermetically sealed zero position.

Alternatively, the combination of a 4/3-way valve, in which A, B and T are connected and P locked in the zero position, with at least one controlled check valve for the dangerous consumer line, or a controlled twin check valve, is possible.

- Pressure switch in channels A and B

To convert an existing unit to two-handed operation, please contact Andreas Maier GmbH & Co. KG.

Mounting:

Plug the cable with the plug into the remote control connector of the pump unit. Set the pressure switch to operate at about 75% of the pressure in the clamping circuit. The M5 threads can be used for external fastening from below.

Operation:

Key switch for turning on and switching to zero position and coupling position. Rotary switch for selecting the following functions - clamping, unclamping and zero position. Two-hand switch for initiating movements. Stop switch for fast switch-off in case of danger. Indicator lights signal the control status.

General:

Re-clamping required following an electrical voltage outage and after the power supply is restored. With pump unit no. 6906, the solenoid on the directional valve remains energised after self-locking.

Note:

Each user of the two-handed safety control panel must determine the necessary performance level of the respective safety function by his own risk assessment and must ensure that this is also complied with.

Subject to technical alterations.

HOLLOW-ROD CYLINDER FOR MULTIPLE USE IN MANUFACTURING PROCESSES

- > clamping force up to 188 kN
- > operating pressure up to 500 bar
- > hollow-piston rod with through-hole, with or without internal thread
- > particularly suitable to convert existing mechanical fixtures into hydraulically operated fixtures
- > for push- and pull operation
- > single and double-acting variants
- > wipers to protect against contamination

At continuous pressures below 80 bar, this must be stated on ordering as a different seal combination may need to be selected.

PRODUCT OVERVIEW:

Type	Clamping force [kN]	Pull force [kN]	Clamping stroke [mm]	No. of models	Operating mode
6920	20 - 125	20 - 125	8 - 20	5	single acting

65003	6920-125	32,0	125	20	64	32,8	1120	6250

Design:

Cylinder barrel from steel, burnished. Piston and piston rod case hardened and ground. Built-in return spring. With sintered bronze filter. 2 wipers and vent screw. Oil supply via threaded port.

Application:

Particularly suitable for retrofitting existing fixtures for hydraulic actuation. When workpieces are clamped onto a machine tool table, the hollow rod cylinder can be fitted over the clamp bolt instead of the nut. The hollow rod cylinders can be used for push or pull applications.

Features:

Completely sealed against contamination and chips by means of sinter metal breather and two wipers. Piston can be moved to its end stop. Oil connection at both ends, thus easy lining up in series.

Note:

Cylinders are designed for use in combination with tempered bolts, material grade 8.8, e. g. DIN 787 and DIN 6379. Bolts matching the hole are recommended. For single acting cylinders there is risk of sucking in coolant during the return stroke. In this case the cylinders have to be protected against the direct effect of coolant. The sinter metal breather should be protected.

65359	6920G-125	32,0	125	20	64	32,8	1120	6400

Design:

Cylinder barrel from steel, burnished. Piston and piston rod case hardened and ground. Built-in return spring. Built-in sintered bronze filter. 2 wipers and vent screw. Oil supply via threaded port.

Application:

Particularly suitable for retrofitting existing fixtures for hydraulic actuation. When workpieces are clamped onto a machine tool table, the hollow rod cylinder can be fitted over the clamp bolt instead of the nut. The hollow rod cylinders can be used for push or pull applications.

Features:

Completely sealed against contamination and chips by means of sinter metal breather and two wipers. Piston can be moved to its end stop. Oil connection at both ends, thus easy lining up in series.

Note:

Cylinder size 20 to 50 are designed for use in combination with tempered bolts, material grade 8.8. For size 80 and 125 bolts of material grade 12.9 must be used. For single acting cylinders there is risk of sucking in coolant during the return stroke. In this case the cylinders have to be protected against the direct effect of coolant. The built in sinter metal breather should be protected.

VH = work stroke, RH = back stroke

Design:

Cylinder barrel from steel, burnished. Piston case hardened and ground. Piston rod is supplied as standard with HC threads. If a piston rod with internal thread is desired, a HELI-COIL insert (diameter x1.5) is screwed into the HC thread. Oil supply via threaded port.

Application:

Particularly suitable for retrofitting existing fixtures for hydraulic actuation. When workpieces are clamped onto a machine tool table, the hollow rod cylinder can be fitted over the clamp bolt instead of the nut. The hollow rod cylinders can be used for push or pull applications.

Note:

Cylinders are designed for use in combination with tempered bolts, material grade 12.9 (e.g. DIN 787). Threaded body provides a wide range of adjustability. Suitable flange nuts DIN 70852.

HELI-COIL thread insert

Accessories

Order no.	Thread insert x length	for cylinder size	Weight [g]
67538	M 8x12	6920D-15-001	1
67546	M10x15	6920D-24-001	3
67595	M12x18	6920D-38-001	4
67603	M16x24	6920D-59-001	9
67611	M20x30	6920D-92-001	19
67629	M27x40,5	6920D-150-001	43

Note:

The HELI-COIL thread insert can be installed using a manual or automatic installation tool. The driving pin is used only for installation, and must subsequently be removed using a special pin-breaker. Without the HELI-COIL insert the piston through-hole has the value of the gap ØM (see dimensions table).

Subject to technical alterations.

No. 6921

Hollow Rod Cylinder

single acting, spring return,
max. operating pressure 400 bar.

CAD

Order no.	Article no.	push-pull force at 100 bar [kN]	push-pull force at 400 bar [kN]	Stroke H [mm]	Vol. [cm ³]	effective piston area [cm ²]	Spring force min. [N]	Weight [g]
63768	6921-70x6	17,8	71	6	11	18,5	700	1675
63149	6921-100x10	24,4	101	10	26	25,9	1500	4800

Design:

Cylinder barrel from steel, burnished. Piston and piston rod case hardened and ground. Retraction by disc springs. 1 wiper. Piston rod with internal thread and two flats (size 70 x 6) or hexagon (size 100 x 10). Built-in sintered bronze filter. Oil supply via threaded port.

Application:

When workpieces are clamped onto a machine tool table, the hollow rod cylinder can be screwed onto the clamp bolt and be joined to the clamp by the two threads in the body. Also suitable for holding and clamping devices directly on a machine tool table. The hollow rod cylinder is designed for use in combination with tempered bolts of material grade 8.8 for size 100x10 and material grade 12.9 for the size 70x6. In case bolts of material grade 8.8 and grade 10.9 are used the pressure has to be reduced for size 70x6 for continuous operation (see diagramme).

Features:

Protected against contamination and chips by a wiper. High forces in a small design.

Note:

For single acting cylinders there is risk of sucking in coolant during the return stroke. In this case the cylinders have to be protected against the direct effect of coolant. The built in sinter metal breather should be protected.

Dimensions:

Order no.	Article no.	Piston dia. [mm]	A	B	dia. C	dia. D	E	F	G	K	L	M	R	S
63768	6921-70x6	55	58	10	16,5	75	26	50	M8	13	65	M16	G1/4	SW22

Application example:

The shown hydraulic clamping device shows casts of several sizes that are clamped by hydraulic pull-down clamp no. 6972F and pull-down counterpart no. 6977. To obtain an efficient means of adjustment, 2 base plates are each equipped with 6 hydraulic nuts no. 6921 which are connected to the grooved table via bolts for T-nut according to DIN 787. The adjustment of the base plate and the clamping of the workpiece can be performed independently by a pump unit with 2 clamping circuits.

Diagram for size 70x6:

67892	6935-53	15,2	53,2	12,5	19,3	15,2	1837

VH = work stroke, RH = back stroke

Design:

Cylinder barrel from steel, hardened and burnished. Piston and piston rod case hardened and ground. Piston rod with through-hole and internal thread. Wiper at piston rod. Return spring from stainless steel. Oil supply via threaded port.

Application:

Particularly suitable to retrofit existing mechanical fixtures for hydraulic actuation. The hollow cylinder can be operated as push or pull cylinder. Universal cylinder for clamping, pushing, locking and punching.

Features:

Clamping cylinder with tapped piston rod. Tapped piston rod ends allow the use of custom end attachments.

Note:

For single acting cylinders there is the risk of sucking in coolant through the breather port. Therefore, the sinter metal breather has to be protected e.g. by cover plates from direct access of coolant. The system has to be completely vented thoroughly during installation.

BUILT-IN CYLINDERS FOR UNIVERSAL USE

- > clamping force up to 70 kN
- > operating pressure up to 400 bar
- > piston with and without internal thread
- > for push- and pull operation
- > quick adjustment, secured using standard grooved nuts
- > single and double-acting variants
- > wipers to protect against contamination

At continuous pressures below 80 bar, this must be stated on ordering as a different seal combination may need to be selected.

Design:

Cylinder from steel, burnished. Piston and piston rod case hardened and ground. Built-in return spring, sintered bronze breather. Wiper at piston rod. Cylinder barrel with metric fine thread for locknuts to DIN 70852. Oil supply via threaded port.

Application:

Suitable for converting mechanical to hydraulic clamping devices. The built-in cylinder is inserted through holes and counter screwed at both ends with grooved nuts. General-purpose clamping element for clamping, pushing, pressing, riveting and punching.

Features:

The metric thread extending over the whole length of the cylinder permits with its two flange nuts DIN 70852 lengthwise adjustment over a large range and fast positioning in the required by two flange nuts. Fast attachment of fixture elements and thrust pieces the piston thread.

Note:

For single acting cylinder types there is a risk of sucking coolant liquid at the return stroke. In this case the cylinder has to be protected against the direct effect of coolant. The built in sinter metal breather should be protected.

VH = work stroke, RH = back stroke

Design:

Cylinder barrel from steel, hardened and burnished. Piston and piston rod case hardened and ground. Piston rod with internal thread. Wiper at piston rod. Cylinder barrel with metric fine thread for locknut to DIN 70852. Oil supply via threaded port.

Application:

Suitable to convert mechanical fixtures into hydraulic operated. The built-in cylinder can easily be mounted and adjusted into fixture walls by flange nuts. Universal cylinder for clamping, pushing, locking, rivetting and punching.

Features:

The metric thread extending over the whole length of the cylinder permits with its two flange nuts DIN 70852 lengthwise adjustment over a large range. Tapped piston rod end allows the use of individual contact bolts.

Note:

The system has to be completely vented during installation.

G1/8 oil connection

Design:

Steel, zinc-plated.

Application:

The flange nuts hold cylinders in the required position.

Subject to technical alterations.

THREADED CYLINDERS - SPACE-SAVINGS AND EASY TO INSTALL

- > clamping force up to 40 kN
- > operating pressure up to 500 bar
- > piston with and without internal thread
- > wipers to protect against contamination
- > oil supply via fixture body
- > single and double-acting variants

At continuous pressures below 80 bar, this must be stated on ordering as a different seal combination may need to be selected.

PRODUCT OVERVIEW:

Type	Clamping force [kN]	Clamping stroke [mm]	No. of models	Operating mode
6929	2,5 - 40,0	5 - 20	8	single acting
6930	5,5 - 40,0	10 - 20	5	single acting
6930D	4,5 - 50,2	12 - 40	6	double acting
6932	2,5 - 24,5	4 - 12	5	single acting
6933	5,5 - 40,0	8 - 12	5	single acting
6934	2,4 - 17,5	5 - 19	5	single acting

PRODUCT EXAMPLES:

NO. 6930

- > clamping force: 5,5 - 40 kN

- > cylinder housing: nitrided, with fine thread

No. 6929-03

Threaded Cylinder for tube connection, with spherical piston rod

single acting, spring return,
max. operating pressure 500 bar,
min. operating pressure 25 bar.

CAD

Order no.	Article no.	Push force at 100 bar [kN]	Push force at 500 bar [kN]	Vol. [cm ³]	Stroke H [mm]	Piston dia. [mm]	Piston area [cm ²]	Spring force min. [N]	Weight [g]
60111	6929-03x10	0,5	2,5	0,5	10	8	0,5	24	80

Design:

Cylinder barrel from steel, burnished. Piston and piston rod case hardened and ground. Wiper at piston rod, union nut with cutting ring.
Oil supply via threaded port.

Features:

Hoses or tubes can be directly screwed onto the threaded cylinders.

Note:

Pistons of these cylinders must not be loaded in retracted position. Care for protection against aggressive lubricants and coolants. As the cylinder has no stop for the tube, the preassembly of the cutting ring has to be effected by means of a hardened pre-mounting tool. Due to the construction size, an internal stop for the piston is not possible. Therefore, please do not operate the threaded cylinder without workpiece, as the spring could be damaged or its spring force could be reduced.

60087	6929-32	8,0	40,0	20	16,00	32	8,0	225	270	930

Design:

Cylinder barrel from steel, burnished. Piston and piston rod case hardened and ground. Wiper at piston rod, with plastic seal for bottom sealing of the cylinder. For no. 6929-02x05 and 6929-02 x 10 sealing with Cu-ring. Oil supply via oil channel in fixture body.

Application:

These threaded cylinders can be used in all types of clamping fixtures. Ideal for pressure bars for tolerance compensation in multiple-workpiece clamping fixtures, and for positioning, holding or ejecting, and clamping workpieces.

Features:

Small dimensions, can be installed closely spaced side-by-side. The cylinders can be screwed into the fixture body up to the hexagon.

Note:

Pistons of these cylinders must not be loaded in retracted position. Care for protection against aggressive lubricants and coolants. The sealing surface of the mounting hole to the thread must be at a right angle and even. For sizes 02x05 and 02x10, a internal stop for the piston is not possible due to the construction size. Therefore, do not operate the threaded cylinder without workpiece, as the spring could be damaged or its spring force could be reduced.

Design:

Cylinder housing from hardened steel, burnished. Piston tempered, ground, nitrided, and treated with a corrosion-resistant coating. Oil supply via oil channel in fixture body.

Application:

These threaded cylinders can be used in all types of clamping fixtures. Ideal for pressure bars for tolerance compensation in multiple-workpiece clamping fixtures, and for positioning, holding or ejecting, and clamping workpieces. Can be used extending or retracting.

Features:

The O-rings are smaller than the diameter of the screw-in thread. This reduces the risk of damage to the seal during the installation process.

Two-piece body makes it easier to change the piston-rod seal. Housing seals against the surface of the hole sleeve. For sizes 05 and 08, there is additional sealing between the housing head and the fixture body.

Small dimensions, can be installed closely spaced side-by-side. The cylinder must be screwed into the fixture body up to its flange.

Note:

Maximum speed of operation 0.5 m/s

Can be supplied on request for higher pressures and temperatures.

Design:

Cylinder barrel from steel, burnished with hex nut. Piston and piston rod case hardened and ground. Wiper at piston rod. Built-in return spring. Sintered bronze breather. Attachment with standard fine thread. Sealing by sealing edge, see „Notes“. Oil supply via oil channel in fixture body.

Application:

Ideal for clamping bars for tolerance compensation in multiple fixtures and for positioning, clamping or discharging workpieces.

Features:

Small dimensions, can be installed closely spaced side-by-side. The cylinders must be screwed into the fixture body up to the hexagon.

Note:

The screw-in cylinders cannot be loaded in the retracted position. For single acting cylinder types, there is a risk of sucking in liquid. The cylinders must be protected against direct penetration of cutting and cooling liquids. The built-in sintered bronze filter should be protected by appropriate arrangement or by a cover. Sealing by sealing edge. For the locating hole, the sealing surface must be at right angles to the thread, flat and not hardened.

61176	6933-32	8,0	40,0	12	9,6	32	8,0	150	240	750

Design:

Cylinder barrel from steel, burnished with hex nut. Piston and piston rod case hardened and ground. Wiper at piston rod. Built-in return spring. Sintered bronze breather. Attachment with standard fine thread. Sealing by sealing edge, see „Notes“. Oil supply via oil channel in fixture body.

Application:

Ideal for clamping bars for tolerance compensation in multiple fixtures and for positioning, clamping or discharging workpieces.

Features:

Small dimensions, can be installed closely spaced side-by-side. The cylinders must be screwed into the fixture body up to the hexagon.

Note:

The screw-in cylinders cannot be loaded in the retracted position. For single acting cylinder types, there is a risk of sucking in liquid. The cylinders must be protected against direct penetration of cutting and cooling liquids. The built-in sintered bronze filter should be protected by appropriate arrangement or by a cover. Sealing by sealing edge. For the locating hole, the sealing surface must be at right angles to the thread, flat and not hardened.

Design:

Cylinder barrel from steel, hardened and burnished. Piston and piston rod case hardened and ground. Piston rod spherical or with internal thread. Wiper at piston rod. Return spring from stainless steel. Oil supply via oil channel in fixture body.

Application:

Threaded cylinders are designed for space saving installation at fixtures. Universal clamping cylinder for clamping, pushing, locking and positioning.

Features:

Small dimensions, can be installed closely spaced side-by-side.

Note:

The cylinders must not be loaded in retracted position. The cylinders must be protected against direct access of lubricants and coolant. The system has to be completely vented during installation.

BLOCK CYLINDERS FOR VARIOUS DESIGN APPLICATIONS

- > piston with internal thread
- > for push- and pull operation
- > with longitudinal and cross bores and perpendicular support groove
- > wipers to protect against contamination
- > single and double-acting variants
- > oil supply via o-ring
- > oil supply via threaded port

At continuous pressures below 80 bar, this must be stated on ordering as a different seal combination may need to be selected.

PRODUCT OVERVIEW:

Type	Clamping force [kN]	Pull force [kN]	Clamping stroke [mm]	Max. operating pressure [bar]	No. of models	Operating mode
6926	10 - 155,5	-	8 - 25	500	28	single acting
6926D	10 - 251,5	6 - 153	16 - 100	500	111	double acting
6936	10,1 - 39,9	-	6,5 - 51	350	7	single acting
6936D	10,1 - 39,9	5,6 - 17,5	6,5 - 51	350	8	double acting

Design:

Cylinder barrel from steel, burnished. Piston and piston rod case hardened and ground. Wiper at piston rod. Piston rod with internal thread. Oil supply via threaded port.

Features:

Universal mounting by means of mounting holes. Each cylinder size is available with two different strokes.

Note:

Maximum traversing speed 0.5 m/s.

For single acting cylinder types there is a risk of sucking coolant at the return stroke. In this case the sinter metal breather shall be piped to a clean, protected area. Screws of strength class 12.9 must be used for fastening.

Untoleranced dimensions are to DIN ISO 2768 medium.

On request:

Special sizes are available on request.

Design:

Cylinder barrel from steel, burnished. Piston and piston rod case hardened and ground. Tandem sealing and wiper at piston rod. Piston rod with internal thread. Oil supply via threaded port.

Features:

Universal mounting to fixtures through fastening holes. Each cylinder size is available with three different strokes.

Note:

Maximum traversing speed 0.5 m/s.
Screws of strength class 12.9 must be used for fastening. Untoleranced dimensions are to DIN ISO 2768 medium.

Design:

Cylinder barrel from steel, hardened and burnished. Piston and piston rod case hardened and ground. Tandem sealing and wiper at piston rod. Piston rod with internal thread. Oil supply via threaded port.

Features:

Universal mounting to fixtures through fastening holes. Each cylinder size is available with three different strokes.

Note:

Maximum traversing speed 0.5 m/s.

The block cylinders are designed with slots for keys. For applications above 160 bar operating pressure, cylinders must be tenon-blocked at slot or backed up at cylinder base. Screws of strength class 12.9 must be used for fastening. Untoleranced dimensions are to DIN ISO 2768 medium.

On request:

Special sizes are available on request.

Subject to technical alterations.

Design:

Cylinder barrel from steel, burnished
Piston and piston rod case hardened and ground. Tandem sealing and wiper at piston rod. Piston rod with internal thread. Oil supply via oil channel in fixture body.

Features:

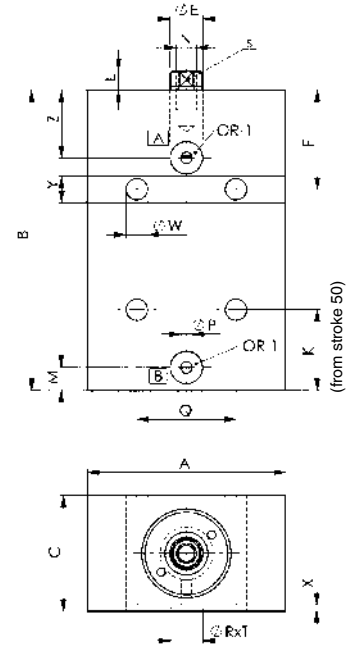

Universal mounting to fixtures through fastening holes.
Each cylinder size is available with three different strokes.

Note:

Maximum traversing speed 0.5 m/s.
Screws of strength classes 12.9 must be used for fastening.
Intoleranced dimensions are to DIN ISO 2768 medium.

On request:

Special sizes are available on request.

Design:

Hardened and burnished steel cylinder barrels. Piston and piston rod case hardened and ground. Piston rod with internal thread. Wiper at piston rod. Return spring from stainless steel. Oil supply via threaded port.

Application:

Universal mounting. Universal block cylinder for e.g. clamping, pushing, locking, rivetting.

Features:

Different strokes are available for each cylinder size. Every model is furnished with parallel and perpendicular mounting holes. Tapped piston rod ends allow the use of custom end attachments.

Note:

For single-acting cylinders, there is a risk of coolant being sucked through the breather port. In such cases the breather port has to be moved to a clean protected area via a connection line. When placing into operation, ensure that all air is bled from the system. For applications above 100 bar operating pressure, the cylinders must be supported by the cross bores at the cylinder body when fastening. Screws of strength class 12.9 must be used for fastening.

VH = work stroke, RH = back stroke

Design:

Cylinder housing made of steel, hardened and blued. Piston and piston rod with internal thread, case-hardened and ground. Wiper at piston rod prevents from contamination.

Application:

Universal mounting to equipment using mounting holes. Universal element clamping, pressurising, riveting and punching.

Features:

Different strokes are available for each cylinder size. Every model is furnished with parallel and perpendicular mounting holes. Tapped piston rod ends allow the use of custom end attachments.

Note:

When placing into operation, ensure that all air is bled from the system. For applications above 100 bar operating pressure, the cylinders must be supported by the cross bores at the cylinder body when fastening. Screws of strength class 12.9 must be used for fastening.

Subject to technical alterations.

Available upon request. Block cylinders with O-ring- or threaded connection as special variant, double-acting, aluminium housing. With individually-adjustable magnetic sensors for position monitoring, and transverse or axial mounting holes. Block cylinders with double crosswise slot.

Block cylinders with position monitoring are used for clamping and releasing tasks and in automatic plant and production operations where they must be integrated into a cycle. The current piston position is detected by magnetic sensors which are mounted in an axial slot for easy adjustment.

DESIGN:

- 350 bar max. operating pressure.
- 16 to 200 mm stroke.
- Cylinder barrel made from aluminium.
- Piston case hardened and ground.
- Compact size.
- Individual connections and mountings are possible.

DESIGN:

- 500 bar max. operating pressure.
- 16 to 200 mm stroke.
- Cylinder barrel made from steel, burnished.
- Piston case hardened and ground.
- Dimensions like standard version 6926D with crosswise slot.
- Oil supply via threaded port.

No. 6926Z

Hook ends, hydraulic

max. operating pressure 400 bar.

Order no.	Article no.	Slot	G	Stroke H [mm]	R	max. possible clamping force [kN]	Weight [g]

326959	6926ZL-16	18, 20, 22, 24	M16	40	G1/4	39	3950

Design:

Cylinder barrel from steel, burnished. Piston and piston rod case hardened and ground. Wiper at piston rod. Piston rod with internal thread. Oil supply via threaded port.

Application:

For tensioning primarily cylindrical parts - on both the machine table and clamping plates. The chain length and clamping force are preset on the counter catch using knurled nuts. The hook end is then placed under hydraulic pressure to tension the chain. The control marking on the piston rod marks the max. stroke and shows how far the hydraulic cylinder has been run out.

Advantage:

Even pressure distribution reduces workpiece deformation.

Hydraulic diagram:

Subject to technical alterations.

No. 6540

Chain clamping set

Hook ends and counter catches tempered. Chain made of tempered steel. Please order fixture for T-slots 6541 separately. Consisting of:

- hook end
- protection set for clamp chain
- counter catch
- 4 roller chains
- 87601: 492 mm (2x), 238 mm (1x), 15.9 mm (1x)
- 87627: 991 mm (1x), 229 mm (1x), 483 mm (1x), 25.4 mm (1x)
- 4 locking links with split pins for connecting
- 6 snap-in plastic elements (for workpiece protection)

Order no.	Slot	Screw G	max. permissible torque [Nm]	max. possible clamping force [kN]	Weight [g]
87601	14, 16, 18	M12	45	15	2628
87627	18, 20, 22, 24	M16	90	40	7640

Application:

Mainly used for clamping cylindrical parts, such as valve bodies, flanges, pump housings, pistons etc. this device can be used both on machine tables and on clamping pallets. Initial selection of the chain length and setting clamping force is carried out at the take-up unit by turning the knurled nut. Finally, the torque necessary to generate clamping force is applied to the tensioning hook. Plastic pressure pads can be inserted in the chain links to protect the workpiece surface.

Advantage:

- Uniform pressure distribution reduces workpiece deformation.
- Workpiece can be protected by plastic pressure pads inserted in the chain links.
- Large range of adjustment (tensioning stroke) at take-up unit and tensioning hook.

Note:

For larger clamping tasks, the clamping hooks, counterholders and clamping chains of size 20 and 24 are used.

Chain stretch at specified torques

376749	24	1500	1485	54	38	33	38,100	120	10575
376764	24	2000	2019	54	38	33	38,100	120	14100

Application:

The individual chain lengths can be joined as required using the connecting links (No. 6540V). The chain can be shortened to any length as required.

Advantage:

- Chain can be extended or shortened to the required length with ease
- both sides usable with counter catches or hook ends
- resistant to temperature influences and soiling
- chains are tensioned to minimise elongation.

On request:

Customised lengths available!

No. 6540KS

Clamp chain protection set

Completely pre-assembled.

Order no.	Size	Max. clamping force to be secured [kN]	Weight [g]
376111	12	15	280
376129	16	40	350
376491	20	75	1313
376558	24	120	1313

Application:

To use the clamp chain safely, the protection set is simply screwed below the hook end or the counterholder. Then, using the supplied connecting link, the protection set is fastened above the hook end or counterholder. This prevents the clamp chain from snapping uncontrolledly if the hook end or counterholder breaks.

Advantage:

- Easy mounting of the protection set
- Safe handling of the clamp chain
- Improved work safety.

Note:

If the protection set is damaged, the entire set must be replaced.

No. 6540F

Spring cotter pin

551515	24	105	180	214 - 284	31	50	120	3517

Application:

The turnbuckle is clamped between the chains using two locking links. The chain is pretensioned through turning, and the play (caused by lengthening of the chain) is removed.

Advantage:

- Optimal application of pretensioning with use of long clamping chains (3 m or longer)
- Counteracting chain stretching for long chains

No. 6540S

Protective elements

for workpiece protection.

Subject to technical alterations.

No. 6541

Mounting kit

For attaching the chain clamping set no. 6540 on the subplate, composed of nut for T-nut, resembling DIN 508, and screw complying with ISO 4762, class 8.8.

Order no.	A	L	M	Weight [g]
84251	14	25	M12	60
84269	16	30	M12	80
84277	18	30	M12	105
84285	18	30	M16	115
84293	20	35	M16	170
84343	22	40	M16	240
84350	24	45	M16	335
376483	14	35 *	M12	88
376509	16	40 *	M12	114
376525	18	40 *	M12	141
376541	18	45 *	M16	189
376566	20	50 *	M16	248
376582	22	50 *	M16	305
376608	24	55 *	M16	407

* For use of the protection set no. 6540KS

Note:

Mounting kit for the sizes 20 and 24 available on request.

No. 902Md

Open ring spanner with torque-wrench fitting

Fits hook end 6540H.
(AMF chain clamping set 6540)
For hexagon clamping nuts.
Drive 1/2" square socket with ball-engagement groove.
Special steel, hardened and zinc-plated.

SW36 / SW46

Order no.	SW	L	S	SW1 [inch]	T	T1	Weight [g]
52514	36	101	60	1/2	7	16	255
52522	46	108	60	1/2	8	16	340

Advantage:

Ideally adapted for the controlled actuation of the hook end 6540-12 and 6540-16 of the chain clamping set.

Note:

The set value for the torque wrench is dependant on insertion dimension „S“.
The operating manual provided with your torque wrench contains the requisite information and calculation formulae.

On request:

SW 65 fits clip no. 6540H - size M20/M24 available on request.

Subject to technical alterations.

PUSH-PULL CYLINDERS, FOR INDIVIDUAL CLAMPING APPLICATION

- > pull force 2,2 to 40 kN
- > operating pressure 350 bar
- > guided or unguided piston rod
- > hardened and chrome-plated piston rod
- > nitrided and burnished body
- > oil supply via threaded port and/or o-ring-sealed ports

At continuous pressures below 80 bar, this must be stated on ordering as a different seal combination may need to be selected.

PRODUCT OVERVIEW:

Type	Clamping stroke [mm]	Pull force [kN]	No. of models	Operating mode
6927B	25,5 - 51,0	5,9 - 17,5	4	single acting
6951KZ/KZP	14,5 - 30,0	2,2 - 40,0	8	single or double acting
6951FZ/FZP	14,5 - 30,0	2,2 - 40,0	8	single or double acting
6951GZ	14,5 - 51,0	2,2 - 13,9	8	single acting

PRODUCT EXAMPLES:

NO. 6927B

- > pull force: 5,9 - 17,5 kN
- > connection type: threaded port

NO. 6951KZP

- > pull force: 2,2 - 40 kN

68122	6927B-18-2	17,5	51,0	51,0	25,4	5,0	1905

Design:

Cylinder barrel from steel, hardened and burnished. Piston rod hardened and chrome plated. Piston rod with internal thread. Wiper at piston rod. Oil supply via threaded port.

Application:

Universal pull cylinder for various applications.

Features:

Piston rod not guided. Tapped piston rod ends allow the use of custom end attachments. Clamping bars can be attached like the swivel clamps. Cylinder body with longitudinal and crosswise mounting holes.

Note:

For single acting cylinders there is risk of sucking in coolant through the breather port. In such cases the breather port has to be piped to a clean protected area. The system has to be completely vented during installation.

66571	6951KZP-11-10	13,9		29,5	11,90	1,64	1520

Design:

Cylinder barrel from steel, hardened and burnished. Piston rod case hardened and chrome plated. Piston rod with internal thread and clamping arm positioning. O-ring for flange seal. Wiper at piston rod. Return spring from stainless steel. Oil supply via threaded connection or oil channel in the fixture body.

Application:

Universal Push-Pull Cylinder for various applications.

Features:

Each cylinder size is available for single or double-acting operation. Various thrust pieces can be attached in the tapped piston rod ends. Clamps can be attached, as with the swing clamps.

Note:

The piston is guided, therefore, the max. permissible oil flow rate Q max. must be observed in order to protect the mechanism. No force must be introduced at the piston when mounting accessory. For single acting cylinders there is risk of sucking in coolant through the breather port. In such cases the breather port has to be piped to a clean protected area. The system has to be completely vented during installation.

327098	6951KZP-33-20	80	40	30	68,4	34,3	2,5	4355

Design:

Cylinder barrel from steel, hardened and burnished. Piston rod hardened and chrome plated. Piston rod with internal thread. O-ring for flange seal. Wiper at piston rod. Oil supply via threaded connection or oil channel in the fixture body.

Application:

Universal Push-Pull Cylinder for various applications.

Features:

Various thrust pieces can be attached in the tapped piston rod ends. Clamps can be attached, as with the swing clamps.

Advantage:

- Increase in the number of balls and slots to 3 to achieve a higher positioning accuracy and repetition accuracy. Also prolongs service life.
- More precise guidance
- contact force of balls into groove increased, thus guaranteeing highly-precise guidance over a long period of us.
- V-profile of the ball running groove guarantees a deeper ball run in the groove wall than at the groove edge.
- New materials for prolonging the service life of piston rod and guide.

Note:

The piston is guided, therefore, the max. permissible oil flow rate Q max must be observed in order to protect the mechanism. No force must be introduced at the piston when mounting accessory. The system has to be completely vented during installation.

To control the oil feed, the throttle/check valve no. 6916-12-04 can be optionally used.

- More precise guidance
- contact force of balls into groove increased, thus guaranteeing highly-precise guidance over a long period of us.
- V-profile of the ball running groove guarantees a deeper ball run in the groove wall than at the groove edge.
- New materials for prolonging the service life of piston rod and guide.

Note:

The piston is guided, therefore, the max. permissible oil flow rate Q max must be observed in order to protect the mechanism. No force must be introduced at the piston when mounting accessory. The system has to be completely vented during installation.

To control the oil feed, the throttle/check valve no. 6916-12-04 can be optionally used.

66712	6951GZ-11-10	13,9	29,5	11,90	1,640	1424

Design:

Cylinder barrel from steel, hardened and burnished. Piston rod case hardened and chrome plated. Piston rod with internal thread and clamping arm positioning. Wiper at piston rod. Return spring from stainless steel. Oil supply via threaded port.

Application:

Universal Push-Pull Cylinder for various applications.

Features:

Each model is available for single or double acting operation. The internal thread at piston rod allows mounting of attachments like clamping arms and set screws.

Note:

The piston is guided, therefore, the max. permissible oil flow rate Q max. must be observed in order to protect the mechanism. No force must be introduced at the piston when mounting accessory. For single acting cylinders there is risk of sucking in coolant through the breather port. In such cases the breather port has to be piped to a clean protected area. The system has to be completely vented during installation. Suitable flange nuts DIN 70852.

SWING CLAMPS - THE SOLUTION FOR COST-EFFECTIVE HYDRAULIC CLAMPING OF WORKPIECES!

DESIGN:

Burnished body, hardened and ground piston rod. Swing clamps are delivered without clamping arm.

APPLICATION:

Swing clamps are used in fixtures of all kinds, especially in applications where workpieces must be freely accessible and loaded from above. Workpieces with complex geometries can be clamped using special clamping arms (available upon request).

FEATURES:

Design variants: > **thread flange**

The swing motion is realized by a patented ball-guide mechanism. Standard swivel angle is 90°.

The tolerance of pivot angle measures $\pm 3^\circ$. The repetition accuracy of the pivot position measures $\pm 1.5^\circ$.

The newly designed clamping-arm mount prevents the induction of forces into the swing mechanism during assembly.

IMPORTANT NOTE:

Clamping arm length, max. permissible flow rate Q max. and clamping arm weight must be observed! In case of a larger flow rates, a throttle/check valve must be connected upstream.

The motion of the swing clamp must not be obstructed. Clamping must only be done in the vertical stroke area.

* details with clamp arm, standard

Design:

Cylinder barrel made of steel, hardened and burnished. Piston rod case hardened and chrome plated. Piston rod with internal thread and clamp arm positioning. Wiper at the piston rod. Return spring from stainless steel. Clamp arm not supplied as standard. Oil supply via threaded port.

Application:

Swing clamps are used particularly in fixtures in which the workpiece must be freely accessible and placed from above. Workpieces with difficult shapes can also be clamped using special clamp arms (available on request).

Features:

Each cylinder size is available for single or double-acting operation. The swing motion employs a patented ball guide mechanism.

Note:

The piston is guided, and so the max. permissible oil flow rate Q max. as well as the clamping arm length and weight must be observed. When mounting accessories at the piston, no force may be applied to the piston. For single-acting cylinders, there is risk of sucking in coolant through the breather port. In such cases the breather port has to be moved to a clean protected area via a connection line. When installing, ensure that all air is bled from the system. Grooved nuts DIN 70852 can also be used for attachment. Other swivel angles are available on request.

SWING CLAMPS - THE SOLUTION FOR COST-EFFECTIVE HYDRAULIC CLAMPING OF WORKPIECES!

DESIGN:

Burnished body, hardened and ground piston rod. Swing clamps are delivered without clamping arm.

APPLICATION:

Swing clamps are used in fixtures of all kinds, especially in applications where workpieces must be freely accessible and loaded from above. Workpieces with complex geometries can be clamped using special clamping arms (available upon request).

FEATURES:

Design variants: > **top flange** > **base flange** > **cartridge flange** > **plug-in mounting**

Top and base-flange models accommodate O-ring as well as threaded hydraulic connections.

There are also designs for drilled oil channels. The swing motion is realized by a rigid 3-way ball-guide mechanism.

Standard swivel angle is 90°. The tolerance of pivot angle measures $\pm 3^\circ$. The repetition accuracy of the pivot position measures $\pm 1.5^\circ$.

The newly designed clamping-arm mount prevents the induction of forces into the swing mechanism during assembly.

IMPORTANT NOTE:

Clamping arm length, max. permissible flow rate Q max. and clamping arm weight must be observed! In case of a larger flow rates, a throttle/check valve must be connected upstream.

The motion of the swing clamp must not be obstructed. Clamping must only be done in the vertical stroke area.

POSITIONING:

Positioning hole for clamp arm:

threaded stud

Positioning bore at the piston rod:

Positioning hole for clamp arm:

Positioning hole for clamp arm (6x60°)

DESIGN:

single acting cylinder

double acting cylinder

BENEFITS:

- > Increase in the number of balls and grooves to 3 to achieve a higher positioning accuracy and repetition accuracy. This also extends the service life.
- > Precise swivel angle of 90°.
- > Increases pressing force of the balls in the swivel slot, which ensures a very precise swivel angle over a long period of use.
- > Improved radius transition from straight to swivel stroke.
- > The simple-acting models receive a stronger spring force to ensure a better return stroke.
- > In addition, all models receive a position-repeatable clamping arm mounting.
- > New materials for extending the service life of piston rod and swivel mechanism.

CODE OF TYPES:

Type 11 = single acting, right swinging
Type 12 = single acting, left swinging

Type 21 = double acting, right swinging
Type 22 = double acting, left swinging

Design:

Cylinder barrel from steel, hardened and burnished. Piston rod case hardened and chrome plated. Piston rod with internal thread. Wiper at piston rod. Supply scope does not include clamping arm. Oil supply via oil channel in fixture body.

Application:

The swing clamp is used particularly in fixtures in which the workpieces must be freely accessible and placed from above. Workpieces with dedicated shapes can also be clamped using special clamp arms (available on request).

Features:

The swing motion is executed via three ball guides, thereby increasing positioning accuracy, repeat accuracy and service life.

Note:

The piston stroke is executed with spheres, so volume flow Q max. must be complied with. Clamping arm length and clamping arm weight must be strictly observed. No force may be applied to the piston when mounting accessories to it. When placing into operation, ensure that all air is bled from the system.

Cl = clamping, Rel = release, ending of item no.: -21 = dual-action, right-pivoting / -22 = dual-action, left-pivoting
* details with clamp arm, standard

Design:

Cylinder barrel made of steel, hardened and burnished. Piston rod hardened. Piston rod with internal thread and clamp arm positioning. Wiper at the piston rod. Clamp arm not supplied as standard. Oil supply via oil channel in fixture body.

Application:

The swivel clamp is used in fixtures in which the workpiece must be freely accessible and inserted from above. Even workpieces with difficult shapes can be clamped using special clamp arms (available on request).

Features:

The swing motion is executed via three ball guides, thereby increasing positioning accuracy, repeat accuracy and service life.

Note:

The piston stroke is executed with spheres, so volume flow Q max. must be complied with. Clamping arm length and clamping arm weight must be strictly observed. No force may be applied to the piston when mounting accessories to it. To equalise height differences on the workpiece, the vertical clamping path must be 50% of the clamping stroke. When placing into operation, ensure that all air is bled from the system. To control the oil feed, the throttle/check valve no. 6916-12-01 can be optionally used with G1/8 and 6916-12-04 with G1/4. Other swivel angles are available on request.

Formula to determine the total mass moment of inertia and the volume flow:

total mass moment of inertia Jges. [kgm²]
Clamp arm mass moment of inertia JH [kgm²]
Piston mass moment of inertia JK [kgm²]
Clamp arm load mH [kg]
Centre of gravity distance Ls [m]
Jges. = JK + JH + mH x Ls² [kgm²]

Volume flow Qmax. [cm³/s]
Volume clamp Vol.sp [cm³]
Minimum permitted clamp time tmin. [s]
Qmax. = Vol.sp / tmin. [cm³/s]

Suitable clamp arms are 6951-XX.

Ending of item no.: -11 = single-action, right-pivoting / -12 = single-action, left-pivoting

* details with clamp arm, standard

Design:

Cylinder barrel made of steel, hardened and burnished. Piston rod case hardened and chrome plated.
Piston rod with internal thread and clamp arm positioning. O-ring for flange seal.
Wiper on the piston rod. Return spring from stainless steel. Clamp arm not supplied as standard.
Oil supply via threaded connection or oil channel in the fixture body.

Application:

The swivel clamp is used in fixtures in which the workpiece must be freely accessible and inserted from above. Even workpieces with difficult shapes can be clamped using special clamp arms (available on request).

Features:

The swing motion is executed via three ball guides, thereby increasing positioning accuracy, repeat accuracy and service life.

Note:

The piston stroke is executed with spheres, so volume flow Q max. must be complied with. Clamping arm length and clamping arm weight must be strictly observed. No force may be applied to the piston when mounting accessories to it. To equalise height differences on the workpiece, the vertical clamping path must be 50% of the clamping stroke. For single-acting cylinders, there is a risk of coolant being sucked through the breather port. In such cases the breather port has to be moved to a clean protected area via a connection line. When placing into operation, ensure that all air is bled from the system. To control the oil feed, the throttle/check valve no. 6916-12-01 can be optionally used with G1/8 and 6916-12-04 with G1/4. **To achieve a controlled clamping sequence, there is the option of screwing the sequence valve 6918-XX-XXX directly into the threaded connection.** Other swivel angles are available on request.

Ending of item no.: -11 = single-action, right-pivoting / -12 = single-action, left-pivoting

* details with clamp arm, standard

Design:

Cylinder barrel made of steel, hardened and burnished. Piston rod case hardened and chrome plated. Piston rod with internal thread and clamp arm positioning. O-ring for flange seal. Wiper on the piston rod. Return spring from stainless steel. Clamp arm not supplied as standard. Oil supply via threaded connection or oil channel in the fixture body.

Application:

The swivel clamp is used in fixtures in which the workpiece must be freely accessible and inserted from above. Even workpieces with difficult shapes can be clamped using special clamp arms (available on request).

Features:

The swing motion is executed via three ball guides, thereby increasing positioning accuracy, repeat accuracy and service life.

Note:

The piston stroke is executed with spheres, so volume flow Q max. must be complied with. Clamping arm length and clamping arm weight must be strictly observed. No force may be applied to the piston when mounting accessories to it. To equalise height differences on the workpiece, the vertical clamping path must be 50% of the clamping stroke. For single-acting cylinders, there is a risk of coolant being sucked through the breather port. In such cases the breather port has to be moved to a clean protected area via a connection line. When placing into operation, ensure that all air is bled from the system. To control the oil feed, the throttle/check valve no. 6916-12 can be optionally used. **To achieve a controlled clamping sequence, there is the option of screwing the sequence valve 6918-XX-XXX directly into the threaded connection.** Other swivel angles are available on request.

SWING CLAMPS - THE SOLUTION FOR COST-EFFECTIVE HYDRAULIC CLAMPING OF WORKPIECES!

DESIGN:

Burnished body, hardened and ground piston rod. Swing clamps are delivered without clamping arm.

APPLICATION:

Swing clamps are used in fixtures of all kinds, especially in applications where workpieces must be freely accessible and loaded from above. Workpieces with complex geometries can be clamped using special clamping arms (available upon request).

FEATURES:

Design variants: > **top flange** > **base flange**

Top and base-flange models accommodate O-ring as well as threaded hydraulic connections.

The swing motion is realized by a rigid 3-way ball-guide mechanism. Standard swivel angle is 90°.

The tolerance of pivot angle measures $\pm 3^\circ$. The repetition accuracy of the pivot position measures $\pm 1.5^\circ$.

The newly designed clamping-arm mount prevents the induction of forces into the swing mechanism during assembly.

IMPORTANT NOTE:

Clamping arm length, max. permissible flow rate Q max. and clamping arm weight must be observed!

In case of a larger flow rates, a throttle/check valve must be connected upstream.

The motion of the swing clamp must not be obstructed. Clamping must only be done in the vertical stroke area.

POSITIONING:

Positioning hole for clamp arm:

single acting cylinder

double acting cylinder

threaded stud

threaded stud

Positioning bore at the piston rod:

SWING DIRECTIONS:

Positioning hole for clamp arm:

DESIGN:

double acting cylinder

BENEFITS:

- > Increase in the number of balls and grooves to 3 to achieve a higher positioning accuracy and repetition accuracy. This also extends the service life.
- > Precise swivel angle of 90°.
- > Increases pressing force of the balls in the swivel slot, which ensures a very precise swivel angle over a long period of use.
- > V-profile of the ball running groove ensures a deeper ball run in the slot wall than on the slot edge.
- > Improved radius transition from straight to swivel stroke.
- > The simple-acting models receive a stronger spring force to ensure a better return stroke.
- > In addition, all models receive a position-repeatable clamping arm mounting.
- > New materials for extending the service life of piston rod and swivel mechanism.

CODE OF TYPES:

Type 21 = double acting, right swinging

Type 22 = double acting, left swinging

Type 210 = double acting, right swinging, extended stroke

Type 220 = double acting, left swinging, extended stroke

CONNECTION OPTIONS:

> o-ring connection

> threaded connection

* details with clamp arm, standard

Design:

Cylinder barrel from steel, hardened and burnished. Piston rod hardened and chrome plated. Wiper at piston rod. Return spring from stainless steel. Supply scope does not include clamping arm. Oil supply via threaded connection or oil channel in the fixture body.

Application:

The swing clamp is used particularly in fixtures in which the workpieces must be freely accessible and placed from above. Workpieces with difficult shapes can also be clamped using special clamp arms (available on request).

Features:

The swing motion is executed via three ball guides, thereby increasing positioning accuracy, repeat accuracy and service life.

Note:

The piston stroke is guided, respect Q max. volume flow. Clamping arm length and clamping arm weight must be strictly observed. No force may be applied to the piston when mounting accessories to it. For single-acting cylinders, there is a risk of coolant being sucked through the breather port. In such cases the breather port has to be moved to a clean protected area via a connection line. When placing into operation, ensure that all air is bled from the system.

To control the oil feed, the throttle/check valve no. 6916-12-04 can be optionally used. **To achieve a controlled clamping sequence, there is the option of screwing the sequence valve 6918-XX-XXX directly into the threaded connection.** Other swivel angles are available on request.

 order no. 60855 for sizes 6951xx-33-xx

Note:

Clamping pressure, flow volume and clamping arm weight must be observed. Clamp arms can be shortened where necessary. Special versions available on request.

No. 6951N

Swing Clamp Arm, double ended

Order no.	Article no.	A	2A	B	C	D	dia. E	G	J	K	L	N	R	Weight [g]
69526	6951N-22-280	140,0	280,0	70,5	28,5	18,4	31,75 +0,05	43,8	12,5	22,5	M16x1,5	25°	25,5	1869
60863	6951N-33-360	180,3	360,7	44,6	30,2	33,8	38,11 +0,05	44,5	14,2	25,6	M16x1,5	25°	35,0	3311

Design:

Tempered and blued steel.

Application:

For swing clamps
 order no. 69526 for sizes 6951xx-22-xx, 6941KP-11-xx
 order no. 60863 for sizes 6951xx-33-xx

Note:

Clamping pressure, flow volume and clamping arm weight must be observed. Clamp arms can be shortened where necessary. It is also essential that clamping or support heights in either side are identical. Special versions available on request.

No. 6951WN

Swing Clamp arm, double-ended

pivoted

Order no.	Article no.	2A	B	C	D	dia. E	F	G	H	J	dia. K	L	M	W max.	Weight [g]

No. 6916-12

Throttle/Check Valve

cartridge flange
max. operating pressure 350 bar.

Order no.	Article no.	A max.	C	D	dia. E	SW	Md max. [Nm]	Q max. [l/min]	G	Weight [g]
326579	6916-12-01	20,7	11,1	15,16	15,9	14	27	5,7	G1/8	47
326611	6916-12-04	20,9	11,2	18,72	21,0	19	47	5,7	G1/4	47

Design:

Housing made of steel, hardened and blued. Compact size.

Application:

For single and double-acting loads. The traversing speed can be set by controlling the flow.

Note:

The screw-in throttle check valve is screwed into the installation bore.
The upstream pressure relief valve in the hydraulic control guarantees to drain the surplus volume.
The throttle check valves should preferably be used for feed control.
Return flow control poses the risk of excess pressure.

No. 6918-XX-XXX

Sequence valve, threaded design

Design:

Housing from steel, hardened and burnished.

Application:

The sequence valve is used in cases where another consumer is connected to the circuit after a set pressure has been reached. The sequence valve ensures a controlled clamping sequence. Once a defined pressure is reached, another hydraulic circuit is opened.

Note:

The sequence valve can be screwed directly into the threaded connection for the swing clamp top flange and base flange types 6951KP, 6951FP, 6941KP and link clamp 6942KK, and with support elements for flange design 6964H and 6964HS. The oil must be supplied via the O-ring connection. The sequence valve can be screwed directly into fixtures as well.

Subject to technical alterations.

DIAGRAM DESCRIPTION:

The diagrams show the maximum operating pressure in relation to the clamping arm length and the resulting clamping force.

Subject to technical alterations.

VERTICAL CLAMPS AND VERTICAL CLAMPS WITH LINEAR STROKE FOR DEMANDING TASKS

VERTICAL CLAMP

- > cartridge flange
- > piston force up to 49 kN
- > operating pressure 250 bar
- > 90° aperture angle
- > oil supply via oil channel in fixture body

VERTICAL CLAMP

- > piston force up to 20,1 kN
- > operating pressure up to 350 bar
- > oil supply via oil channel in fixture body

VERTICAL CLAMP WITH LINEAR STROKE

- > hydraulic force up to 9,8 kN
- > operating pressure 250 bar
- > oil supply via oil channel in fixture body

PRODUCT OVERVIEW:

Type	Hydraulic force, piston force [kN]	No. of models	Max. operating pressure [bar]	Operating mode
6958E	7,8 - 49,0	3	250	double acting
6958SU/ST	7,0	1	350	single acting

Sp = clamp, Lo = unclamp

Design:

Housing made of steel, outer surface nickel-coated, piston rod hardened. Clamp arm not included. Housing with two holes for connection of anti-twist protection. One cylinder pin for anti-rotation device is enclosed loose. Oil supply via oil channel in fixture body.

Application:

Vertical clamp is especially suited for clamping fixtures in which oil is supplied through conduits drilled in the fixture body. Insert for clamping fixtures with limited space. Installation of the vertical clamp can be adjusted 360°.

Features:

Large clamping force in the smallest installation space. Clamping lever opens 90°, resulting in easy loading or removal of the workpieces, manually or by robots.

Note:

The insertion bevels for the seals must not have any sharp transitions. Mill the thread up to the flat. Lubricate housing for mounting. For installation, use hook spanner for size 20 = order no. 54916 and for size 30 = order no. 54940 and for size 50 = order no 54973.

On request:

Other sizes available on request.

322255	6958ST-16	2,0	7,0	1,9	16	2	334821	290

Design:

Cylinder body from steel, burnished. Piston rod nitrided. Wiper at piston rod. Built-in return spring. Supply scope includes clamping lever pin, but not clamping lever. Oil supply via oil channel in fixture body.

Application:

This vertical clamp can be used for clamping in cavities or in very tight spaces.

Features:

Small dimensions, can be installed closely spaced side-by-side. The clamping levers can be exchanged easily in the installed position.

Note:

Screws according to ISO4762 M6, strength class 12.9, lightly oiled, tightening torque $M_d = 18 \text{ Nm}$ not supplied as standard.

During unclamping, the vertical clamp allows a **max. dynamic pressure of 3 bar**, which must be strictly taken into account when using control valves.

Cylinder body made of steel, chemically nickel-plated. Piston rod nitrided. Wiper at piston rod. Built-in return spring. Scope of supply includes clamp arm pin, but clamp arm not included.

Application:

This vertical clamp can be used for clamping in cavities or in very tight spaces.

Features:

Small dimensions, can be installed closely spaced side-by-side. The clamping arms can be exchanged easily in the installed position.

Note:

Screws according to ISO 4762, strength class 12.9, lightly oiled, are not supplied as standard.

During unclamping, the vertical clamp allows a **max. dynamic pressure of 3 bar**, which must be strictly taken into account when using control valves. Important: Please note the cross-section of the supply line.

Design:

Made of aluminium, red anodised.

Supply scope includes O-ring dia.9x2, threaded plugs and fastening screws.

Application:

The surface-mounted block with O-ring connection from below and threaded connection can be flanged into the fixture as an adapter over the control channel without restriction for the cylindrical part of the vertical clamp or where the control oil supply to the vertical clamp has to be routed via external lines.

Note:

The flange surface on the fixture must be even, and must have a surface finish of Rz 6.3 in the area of the O-ring sealing surface. Other lengths are available on request.

Sp = clamp, Lo = unclamp

Design:

Hydraulic cylinder as a drop-in cartridge. Top mounting with four cylinder screws (resistance min. 10.9); these are supplied as standard. All components are made of hardened steel, tempered and burnished. Piston and pivot bolts are made from tempered steel, hardened and nitrided. Metal wiper to protect the dirt wiper is integrated into the housing. Compressed air nozzle for pneumatic clamping control. Pivot bolts, tensioning straps and compressed air nozzle are supplied as standard, but not clamping arms. Oil supply via oil channel in fixture body.

Application:

The double-acting vertical clamp is highly suited to clamping in clamping pockets. For clearly defined return movements.

Features:

Small dimensions. Allows close side-by-side positioning. Clamping levers easy to change with built-in vertical clamp. The horizontal centre axis at the clamping lever and the pressure point on the workpiece lie in one plane. This prevents relative movement on the workpiece. To protect the O-rings sitting radially on the clamp, the cross channels at the installation hole must be rotated freely and equipped with insertion lead-ins. If the vertical clamp is closed, the compressed air that previously streamed out freely is blocked in the compressed air nozzle. The resulting back pressure can be used for clamping control with the help of a signal converter.

Note:

The signal converter is not included in the supply scope.

The lever ratio B to C is 1 to 1.5 for the standard levers!

In preparing the blank levers, deviations that cause a higher clamping force are permitted only in exceptional cases.

Cl = clamping, Uncl = unclamp

* Specifications with clamping arm, standard

Design:

Housing, piston, piston crown made of tempered steel, tempered and nitrided, visible components, burnished.
Two brass wipers integrated on the joint head. Connections for pneumatic monitoring of the clamping arm position.
Supplied as standard with 4 x cylinder screws (strength 12.9) and clamping arm. Oil supply via oil channel in fixture body.

Application:

The MINI vertical clamp is preferred for use in devices with little installation space. Through the oil supply in the fixture body, a very close array of the clamping elements is possible. The clamping arm position can be monitored pneumatically in the release and clamping position. Workpieces can be installed or removed automatically with handling devices.

Features:

The double-acting MINI vertical clamp permits a clearly defined movement of the clamp arm. The horizontal centre axis at the clamping lever and the pressure point on the workpiece lie in one plane. The pneumatic monitoring of the clamp arm position enables use in automatic production processes. The mechanism of the clamp is encapsulated by brass wipers, thereby ensuring very good protection against dirt.

Note:

Collision of the workpiece with the clamping arm must be avoided during loading and unloading of the clamp. Soiling at the vertical clamp must be considered or avoided through inclusion in the cleaning process. The lever ratio and operating pressure must be observed when using special clamping levers.

Cl = clamping

* Specifications with clamping arm, standard

Design:

Hydraulic clamp as drop-in cartridge with hardened running socket, which can be screwed into the fixture. Top mounting with four cylinder screws (resistance min. 12.9); these are supplied as standard. All components are made from hardened, tempered and burnished steel. Piston and pivot bolts are made from tempered steel, hardened and nitrided. Metal wiper to protect the dirt wiper is integrated into the housing. Compressed air nozzle for pneumatic clamping control. Pivot bolts, tensioning straps and compressed air nozzle are supplied as standard, but not clamping arms. Oil supply via oil channel in fixture body.

Application:

The double-acting vertical clamp is preferred for use in hydraulic fixtures in which there is very little installation space for a hydraulic clamping element. For complex workpieces, a small area is sufficient to clamp the workpiece. Through the oil supply in the fixture body, a very close array of the clamping elements is possible. Pneumatic release control permits monitoring of the clamp arm. Workpieces can be installed or removed automatically with handling devices.

Features:

The double-acting vertical clamp permits a clearly defined movement of the clamp arm. After the rotary movement of the clamping arm, there follows a linear clamping stroke on the workpiece, which can compensate for large workpiece tolerances. There is no relative movement on the workpiece during its clamping. Very small dimensions, so workpieces can be installed closely spaced side-by-side. Due to the pneumatic release control, the clamp is used optimally in automated sequences.

Note:

Collision of the workpiece with the clamping arm must be avoided during loading and unloading of the clamping fixture. When designing the clamping fixture, the clamping position must be laid approximately in the middle of the clamping stroke in order to have enough reserve for workpiece tolerances. Soiling at the vertical clamp must be considered or avoided through inclusion in the cleaning process. The signal converter is not supplied as standard. The lever ratio must be observed when using special clamping levers.

Dynamic pressure monitoring:

closed: clamped

open: unclamped

Sp = clamp, Lo = unclamp

* Clamping force when using standard clamping lever

Design:

Hydraulic cylinder as a drop-in cartridge. Top mounting with four cylinder screws (resistance min. 10.9), these are included in the supply scope. All components from hardened, tempered and burnished steel. Piston rod and hinge pins from hardened steel, tempered and nitrided. Additional bronze wiper for piston rod protection. Supply scope includes hinge pins and tension plates, but not clamping levers. Oil supply via oil channel in fixture body.

Application:

The double-acting link clamp is highly suited to clamping in clamping pockets.

Features:

Small dimensions. Allows close side-by-side positioning. Clamping levers easy to change with link clamps mounted. The clamping lever centre axis and the pressure point on the workpiece are always in one plane at (Z). This prevents relative movement on the workpiece. The integrated cartridge is stepped. This prevents the radial O-rings from becoming damaged as they are installed in or removed from the cross channels.

Note:

With standard levers, the ratio of B to C is 1 to 1.5.

In preparing the blank lever, deviations that cause a higher clamping force F1 are permitted only in exceptional cases.

Design:

Steel, burnished.

Supply scope includes O-ring dia.9x2, threaded plugs and fastening screws.

Application:

The surface-mounted block can be flange-mounted as an adapter via the control channels in the fixture. It can also be arranged on the fixture and used there when the control oil supply has to be routed to the link clamps via external lines.

Note:

The flange surface on the fixture must be even for using the O-ring connection and must have a surface finish of Rz 6.3 around the O-ring sealing surface. The flange surface on the fixture must be even for using the threaded connections.

Other lengths available on request.

No. 6959KL

* Specifications with clamping arm, standard

Design:

Cylinder housing from hardened steel, tempered. Top mounting with four cylinder screws (resistance min. 12.9), these are included in the supply scope. Pistons and bolts from hardened steel, tempered, ground and nitrided. All parts nickel plated.
Supply scope includes hinge pins and tension plates, but not clamping levers. Oil supply via threaded port or oil channel in fixture body.

Application:

The lever-type clamping fixture is used in clamping devices where workpieces need to be freely accessible and must be placed in from above. Particularly well suited for clamping in clamping pockets. Good corrosion resistance and high surface hardness (approx. 615 HV) is provided by chemical nickel plating (specifications MIL-C-2607 AE, ASTM B733 and AMS 2404D).

Features:

Top flange version, lever mechanism can be turned in the range of 180° in 90° steps. Special designs are possible.

Note:

Proximity switch and electrical pressure-point monitoring can be supplied on request.

Subject to technical alterations.

TOGGLE JOINT CLAMP FOR UNIVERSAL USE

- > operating pressure 250 bar
- > hardened and chrome-plated piston rod
- > heat-treated bolts
- > PTFE bearings
- > safe clamping or locking by clamp moving beyond deadcentre
- > oil supply via threaded port

At continuous pressures below 80 bar, this must be stated on ordering as a different seal combination may need to be selected.

PRODUCT OVERVIEW:

Type	Clamping height [mm]	Clamping force [kN]	No. of models	Operating mode
6960C	57 - 86	6 - 22,7	3	double acting

PRODUCT EXAMPLE:

NO. 6960C

* at p max. or pD max.

** pD = pressure during differential switching

Design:

Hardened steel, burnished, with hydraulic cylinder mounted ready for connection to standard double circuit (see circuit Fig. 1) or differential circuit (see circuit Fig. 2). Oil supply via threaded port.

Application:

The clamp is particularly suitable for use in transfer and special-purpose machines. Any thrust pieces can be attached to the sturdy holding arm. With the differential circuit (see Fig. 2 below) the differential piston area A2 of the cylinder is directly connected to P of the pressure generator, while the full piston area is connected by a 3/2-way seat valve.

Features:

The clamp, of machine quality, is maintenance-free thanks to its tempered and ground shafts which run in Teflon bearings. As a result of the hydraulic cylinder operation the possible clamping force is the same as the permissible holding force. The large aperture enables unhindered workpiece handling.

Note:

Please urgently observe the maximum pressure values in the table above.

Design:

The actuating piston is single-acting. Cylinder body, clamping segments and tensioning bolts from hardened steel, gas-nitrided. Four-part clamping segments are externally serrated. A $\varnothing 8$ H7 centring hole located on the underside of the clamping element. Two fastening screws are included in the supply scope. Oil supply via threaded connection or oil channel in the fixture body.

Application:

The hydraulic bore clamp is preferred for use on workpieces with complex external geometries that must be clamped for machining. After the clamping segments are applied to single-attachment clamping holes with low depth, a safe 5-sided processing can be performed without difficulty. Workpieces can be installed or removed automatically with handling devices.

Features:

The tension bolt has the shape of a four-sided pyramid at the coupling point to the clamping sleeve. The clamping sleeve segments have this shape also, thus ensuring contact on the entire surface in every position of the tension bolt. This facilitates a high clamping force and ensures very low wear. Elastic rings hold the clamping segments together and seal them against entry of chips. Depending on the material, the external serration is pressed into the clamping hole with more or less force, thus permitting the required positive fit. The built-in plate springs achieve a maximum pull-down stroke of approx. 0.2 mm.

The tension bolt has a pyramid shape for improved pre-centring of workpieces.

The bore clamp is also the contact surface for the workpiece. The workpiece contact surface is hard-metal coated ($\mu 0.3$), thereby significantly increasing the displacement force.

The eccentric arrangement of the clamping elements is especially suited for clamping workpieces with circumferential contact edge, such as gear and engine housings, oil pans and similar workpieces.

Note:

The lateral force when inserting the workpiece must not exceed the „lateral force“ table value. The radial force must be observed.

Please check with us for clamping hardened workpieces or those from GG / GGG.

323469	6970D-09-60	5,0	8	8,9 - 9,8	10	1000
323485	6970D-10-60	5,0	8	9,9 - 10,8	10	1000

Design:

The actuating piston is double-acting. Cylinder body, clamping segments and tensioning bolts are from hardened steel, gas-nitrided. Two-part clamping segments are externally serrated. A $\text{Ø } 8 \text{ H7}$ centring hole located on the underside for positioning the clamping elements. Supply scope includes three fastening screws. Oil supply via oil channel in fixture body.

Application:

The hydraulic bore clamp is preferred for use on workpieces with complex external geometries that must be clamped for machining. After the clamping segments engage into clamping holes attached on one side with low depth, reliable 5-sided machining does not present a problem. Workpieces can be installed or removed automatically with handling devices.

Features:

Two clamping segments are spread in parallel, thus ensuring contact on the entire surface in every position of the tension bolt. This facilitates a high clamping power and ensures very low wear. Elastic rings hold the clamping segments together and seal them against entry of chips. Depending on the material, the external serration is pressed into the clamping hole with more or less force, thus permitting the required positive fit. The built-in plate springs achieve a max. pull-down stroke of approx. 0.2 mm during clamping.

The integrated air connection is used for cleaning the clamping control. With a suction volume flow meter, the volume flow is measured in the unclamped and clamped state of the workpiece. The difference is used for clamping control. The max. operating pressure should not exceed 6 bar here.

The holding bolts are sword-shaped for better pre-centring of the workpieces. The complete clamping-segment / tension bolt unit can be turned so that an optimal force flow towards the workpiece centre can be set and locked. By setting the clamping elements, overloading of the clamping hole (spreading force) with low clamping rim is avoided.

The drill clamp is simultaneously a contact surface for the workpiece. The workpiece contact surface is hard-metal coated ($\mu 0,3$), which markedly increases the displacement force.

The eccentric arrangement of the clamping elements is especially suited for clamping workpieces with circumferential contact edge, such as gear and engine housings, oil pans and similar workpieces.

Note:

The lateral force when inserting the workpiece must not exceed the „lateral force“ table value. The radial force must be observed.

Please check with us for clamping hardened workpieces or those from GG / GGG.

556564	6970CD-07	2,76	4,1	5	7,0 - 7,7	8,5	3,7	150	275

Design:

The actuating piston is double-acting. Body, clamping segments and tension bolts are made of nitrided tempered steel. Two-part clamping segments are externally interlocked. Four fastening screws are supplied as standard. Oil supply via oil channel in fixture body.

Application:

The hydraulic bore clamp is preferred for use on workpieces with complex external geometries that must be clamped for machining. After the clamping segments are applied to single-attachment clamping holes with low depth, a secure 5-sided processing can be performed without difficulty. Workpieces can be installed or removed automatically with handling devices.

Features:

Two clamping segments are spread in parallel, thus ensuring contact on the entire surface in every position of the tension bolt. This facilitates a high clamping power and ensures very low wear. Elastic rings hold the clamping segments together and seal them against entry of chips. Depending on the material, the external serration is pressed into the clamping hole with more or less force, thus permitting the required positive fit. The built-in plate springs achieve a max. pull-down stroke of approx. 0.2 mm during clamping. The integrated air connection L1 is used for cleaning the clamping area. This blow-off can also be used as a mount check for blind holes.

The integrated air connection is used for cleaning the clamping control. With a suction volume flow meter, the volume flow is measured in the unclamped and clamped state of the workpiece. The difference is used for clamping control. The max. operating pressure should not exceed 6 bar here.

The tension bolts are sword-shaped for better pre-positioning of the workpieces. The complete clamping-segment / tension bolt unit can be turned 90° so that an optimal force flow towards the workpiece centre can be set and locked. By setting the clamping elements, overloading of the clamping hole (spreading force) with low clamping rim is avoided. The drill clamp is also a contact surface for the workpiece. The workpiece contact surface is hard-metal coated ($\mu = 0.3$), which markedly increases the displacement force.

Note:

The lateral force when inserting the workpiece must not exceed the "lateral force" table value. The radial force must be observed.

Please contact us if clamping hardened or cast workpieces.

On request:

Bore clamps for other hole diameters available upon request.

556570	6970CD-13	5,0	7,5	8	12,9 - 13,8	9	10,0	535

Design:

The actuating piston is double-acting. Body, clamping segments and tension bolts are made of nitrided tempered steel. Four-part clamping segments are externally interlocked. Four fastening screws are supplied as standard. Oil supply via oil channel in fixture body.

Application:

The hydraulic bore clamp is preferred for use on workpieces with complex external geometries that must be clamped for machining. After the clamping segments are applied to single-attachment clamping holes with low depth, a secure 5-sided processing can be performed without difficulty. Workpieces can be installed or removed automatically with handling devices.

Features:

The tension bolt has the shape of a four-sided pyramid at the coupling point to the clamping sleeve. The clamping sleeve segments have this shape also, thus ensuring the sleeve segments have contact on the entire surface in every position of the tension bolt. This facilitates a high clamping power and ensures very low wear. Elastic rings hold the clamping segments together and seal them against entry of chips. Depending on the material, the external serration is pressed into the clamping hole with more or less force, thus permitting the required positive fit. The built-in plate springs achieve a max. pull-down stroke of approx. 0.2 mm during clamping. The integrated air connection L1 is used for cleaning the clamping area. This blow-off can also be used as a mount check for blind holes.

The integrated air connection is used for cleaning the clamping control. With a suction volume flow meter, the volume flow is measured in the unclamped and clamped state of the workpiece. The difference is used for clamping control. The max. operating pressure should not exceed 6 bar here.

The tension bolt has a pyramid shape for better pre-positioning of the workpieces. The drill clamp is also a contact surface for the workpiece. The workpiece contact surface is hard-metal coated ($\mu = 0.3$), which markedly increases the displacement force.

Note:

The lateral force when inserting the workpiece must not exceed the "lateral force" table value. The radial force must be observed.

Please contact us if clamping hardened or cast workpieces.

PULL-DOWN CLAMPS AND SIDE CLAMPING ELEMENTS WITHOUT PULL-DOWN ACTION FOR OPTIMAL 3-SIDED MACHINING

PULL-DOWN CLAMP

- > clamping force up to 50 kN (single acting),
- > clamping force up to 32 kN (double acting)
- > operating pressure up to 400 bar
- > independent of clamping and pull-down stroke
- > oil supply via threaded port or oil channel in the fixture body

SIDE CLAMPING ELEMENT

- > clamping force up to 27,5 kN
- > operating pressure up to 250 bar
- > lateral clamping without pull-down action
- > oil supply through oil channels in the fixture body

At continuous pressures below 80 bar, this must be stated on ordering as a different seal combination may need to be selected.

PRODUCT OVERVIEW:

Type	Operating pressure [bar]	Clamping force [kN]	Clamping stroke [mm]	No. of models	Oil connection	Operating mode

66985	6972F-50	50,0	12	40	15	350	340	8800

Design:

Cylinder body from hardened steel, burnished. Piston case hardened and ground. Exchangeable jaws. Standard version with serrated and hardened jaws. Complete with 2 fastening screws to ISO, built-in return spring. All oil channels are sealed. Oil supply via threaded connection or oil channel in the fixture body.

Application:

Pull-down clamps are used whenever clamping is possible only laterally and the workpiece nevertheless has to be held firmly on the machine tool table. The hydraulic principle enables high pressing and pull-down forces. Mounting by two bolts from above or by four bolts from the bottom.

Features:

Horizontal and vertical movement is independent of each other (no locked coupling) giving a true pull-down effect. No raising of the clamping jaw, because the clamping bolt is right behind the jaw. Suitable for incorporation in fixtures. New design of jaw connection with rubber buffer ensures sliding without any play.

Note:

The maximum pull-down stroke of the jaw must not exceed dimension G. Do not overtighten the fastening screws! Observe max. tightening torque Md. The oil channel can be sealed from below. High variability by oil connection on two sides and bottom oil channel. Jaw and hydraulic piston are connected by a joint to prevent the induction of bending forces into the piston, thus increasing the element's service life.

Pull-down force = approx. 1/3 the applicable clamp force

The hole ØD can be used for additional support or positioning.

320614	6972D-32	32	12,5	12	32	9,7	4,0	46	4900

Sp = clamp, Lo = unclamp

Design:

Cylinder body from hardened steel, burnished. Piston case hardened and ground. Exchangeable jaws. Standard version with serrated and hardened jaws. Complete with 4 fastening screws to ISO, O-ring and oil plugs, particle wiper at clamping bolt. Oil supply via threaded connection or oil channel in the fixture body.

Application:

Pull-down clamps are used whenever clamping is possible only laterally and the workpiece nevertheless has to be held firmly on the fixture body. The hydraulic principle facilitates high pressing and pull-down forces. This clamp can be used on fixture bodies with manifold-type oil supply. Fastening is facilitated from above by four screws.

Features:

Quick and safe return movement, independent of the line lengths or the numbers of elements in the circuit. Independent horizontal and vertical movement (no locked coupling), giving a true pull-down effect. Lifting of the clamping jaw is prevented by the location of the clamping bolt right behind the jaw. Suitable for incorporation in fixtures. New design of jaw connection with rubber buffer ensures a sliding without any play.

Note:

The maximum pull-down stroke of the jaw must not exceed dimension G. Do not overtighten the mounting fasteners! The maximum permissible torque must not be exceeded. The bottom oil channel is plugged by a sealing washer and a ISO 4762 - M 5x10 bolt. Minimum operating pressure is 40 bar. High variability by oil connection on two sides and bottom oil channel. Jaw and hydraulic piston are connected by a joint to prevent the induction of bending forces into the piston, thus increasing the element's service life. Pull-down force is equal to approx. 1/3 of the corresponding clamping force.

67520	6977-50	50	M20x100	5200

Design:

Cylinder body made of tempering steel, blued. Exchangeable jaws. Standard version with serrated and hardened jaw. Jaw exchangeable. Complete with two mounting bolts (ISO).

Application:

Purely a counter-hold when using a hydraulic or mechanical pull-down clamp. The workpiece is pulled down onto the machine table by the horizontal force that is applied.

Features:

The smooth clamping jaw moves always against the machine tool table surface, i.e. the stop position is always the same. Clamping on slotted table possible lengthwise and crosswise. No raising of the clamping jaw, because the clamping bolt is right behind the jaw. Suitable for incorporation in fixtures. New design of jaws connection with rubber buffer ensures sliding without any play.

Note:

The maximum pull-down stroke of the jaw must not exceed dimension G. The hole $\varnothing D$ can be used for additional support or positioning.

562197	6978CDA-28	16,5	27,5	3	562537	562534	1250

Design:

Housing made of steel, burnished. Tension slide hardened. Alignment by cylinder pin. Integrated support control and grooved clamping jaw. Oil supply via oil channel in fixture body.

Application:

For clamping workpieces in a linear direction. Compact design thanks to integrated support and support control. A pneumatic support control is included as standard, which can be connected if required. The support height can be adjusted to the workpiece height by means of shims.

Features:

High flexibility through individually designed and exchangeable clamping jaws.

Note:

The installation hole must be free of burrs. Seals and housings must be greased during installation. Avoid chips from gathering via oil channels.

Installation dimensions:

562201	6978CDA-28-06	8	10	13	8	5,5	8	4

Design:

Tempered steel, hardened and tempered, serrated clamping surface, with bolt.

Application:

For all workpieces with normal clamping faces.

No. 6978CDAR-28-06

Clamping jaws blank, smooth

562202	6978CDAR-28-06	8	10	13	8	9,5	12	6,5

Design:

Tempered steel, unhardened, with smooth clamping surface, with bolt.

Application:

These clamping jaws can be shaped into any clamping form or ground flush for sensitive workpieces.

Subject to technical alterations.

Subject to technical alterations.

CENTRING CLAMPS WITH TWO OR THREE CLAMPING POINTS

- > clamping force up to 28 kN
- > operating pressure up to 350 bar
- > centring in holes
- > clamping in holes
- > oil supply via oil channels in fixture body or via threaded port with connector plate

PRODUCT OVERVIEW:

Type	Clamping force [kN]	Clamping stroke [mm]	Clamping points	No. of models	Operating mode
6974-20XX - MINI	14	3	2	9	double acting
6974-30XX - MINI	14	3	3	9	double acting
6974-20XX - MAXI	11,2 - 28	4 - 6,9	2	9	double acting
6974-30XX - MAXI	11,2 - 28	4 - 6,9	3	9	double acting

* The clamping force is distributed centrally over the 2 clamping points.

Design:

Double-acting centring clamp with two clamping points.
All components from high-grade hardened and nitrided steel. Oil supply via oil channel in fixture body.

Application:

For centring and clamping workpieces with machined or cast holes, cutouts or penetrations.
Element screwed directly onto the fixture body, sealed with O-ring.

Features:

The centring clamp is fastened from below; oil is supplied through drilled channels in the fixture body. If the centring clamp is fastened from above and oil supplied through conduits drilled in the fixture body, a connection plate for O-ring connection is needed. If the centring clamp is fastened from above and oil supplied through pipes, a connection plate for pipe connection is needed.

Note:

The practical combination of 2-point and 3-point elements can avoid over-determined clamping states. Unsuitable for use on lathes.

Design:

Tempering steel, TEM-deburred and phosphatised.

Application:

If the centring clamp is fastened from above and oil is supplied through pipes.

Order no. 329011 for items 6974-X054; 6974-X061 and 6974-X068

Order no. 329037 for items 6974-X076; 6974-X083 and 6974-X090

Order no. 329144 for items 6974-X098; 6974-X109 and 6974-X119

Subject to technical alterations.

SUPPORT ELEMENTS FOR STRESS-FREE CLAMPING AND LOW-VIBRATION MACHINING

- > supporting force up to 55,6 kN
- > observe safety factor for supporting force
- > operating pressure up to 400 bar
- > piston with internal thread
- > wipers to protect against contamination
- > oil supply via oil channel in the fixture body, threaded connection or an O-ring connection on the underside
- > various design variants:
 - block version
 - installation version
 - screw-in version
 - flange version
- > also available with dynamic pressure monitoring

PRODUCT OVERVIEW:

Type	Supporting force [kN]	Supporting stroke [mm]	Positioning	No. of models	Operating mode
6961F/L	8,0 - 20,0	6,0 - 10,0	spring/air	6	single acting
6962F/L	8,0 - 20,0	6,0 - 10,0	spring/air	6	single acting
6964F/L	4,4 - 55,6	6,5 - 19,0	spring/air	12	single acting
6964H	4,4 - 35,6	6,5 - 15,8	hydraulic	19	single acting
6964HS	8,9 - 17,8	6,5 - 12,5	hydraulic	4	single acting

PRODUCT EXAMPLES:

NO. 6961F

- > supporting force: 8 - 20 kN
- > three design variants

NO. 6964H

- > supporting force: 4,4 - 35,6 kN
- > two design variants

NO. 6964HS

- > supporting force: 8,9 - 17,8 kN
- > two design variants

SUPPORT ELEMENTS - TECHNICAL INFORMATION

OPERATING PRESSURE:

To achieve a guaranteed clamping function, the min. operating pressure must not be fallen below. The highest clamping force is achieved at max. operating pressure.

CONTACT FORCE:

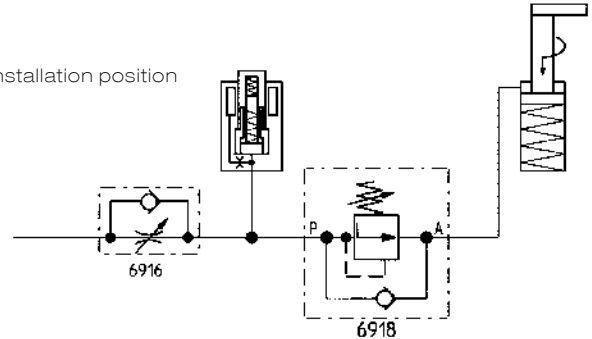

The spring-loaded contact force is at its greatest at a min. distance between the installation position and workpiece.

SHEAR FORCES:

Support elements only absorb forces in axial direction of the piston. If shear forces occur, the thin-walled clamping sleeve will be deformed. The function of the support element can no longer be guaranteed.

VOLUME FLOW:

The permissible volume flow must not be exceeded. The permitted volume flow can be controlled with a throttle/check valve. If the volume flow is too high, the oil pressure increases so quickly that the anchor is clamped before it is on the workpiece. If several support elements are used, the permissible volume flow is the total of the individually permissible volume flows.

ELASTIC CHANGE IN LENGTH:

Just like any steel component, the support elements also have an elastic behaviour. During heavy loading, a setting behaviour occurs.

VENTING:

Support elements only need a very small oil volume. Since the hydraulic oil in the connection line hardly moves, careful venting is necessary. Air in the oil can prolong the clamping time considerably. If venting is not carried out properly, a diesel effect may occur and destroy the element. Always vent at low pressure.

DIESEL EFFECT:

If petroleum containing air bubbles is compressed very quickly, the bubbles will be heated so strongly that a self-ignition of the air/gas mixture could occur. As a result, a very high pressure and temperature increase occurs locally, which could also damage seals as well as cause accelerated ageing of the oil.

SPRING SPACE VENTILATION:

The free loading and venting of the spring spaces must be ensured. The pressure connection must be protected or arrayed properly so no coolant is taken in. Failure to observe this can lead to malfunctions.

COOLANT AND SHAVINGS:

Support elements should normally be protected against shavings and cooling water.

CONTROLLING THE CLAMPING SEQUENCE:

The sequence of supports and clamps must be controlled time-dependent or pressure-dependent. This can be performed by sequence valves 6918, 6918-XX-XXX or by sequence valve 6918-80-10.

PRESSURE REDUCTION OF THE CLAMPING ELEMENTS:

The pressure in the clamping circuit is reduced with a pressure control seat valve 6917.

SUPPORTING FORCE:

The permissible loading force of support elements must always be regulated so that the clamping force of the clamping elements used and the static and dynamic machining forces can be absorbed safely. Permissible loading force minus clamping force minus safety reserve results in the possible machining force.

If the total number of occurring forces exceeds the permissible loading force, the anchor of the support element will be pressed backwards thereby damaging the support element.

The supporting force should always be at least twice as high as the clamping force.

COMBINATIONS OF SUPPORT ELEMENT WITH SWING CLAMP

Example of support element 6964H-04-1 and swing clamp 6952E-02-21

	min. operating pressure [bar]	max. operating pressure [bar]	max. supporting force [kN]	max. clamping force [kN]
support element	50	350	4,4	-
swing clamp	40	350	-	2,0

POSSIBLE MACHINING FORCE AT 350 BAR:

perm. loading force = 4,4 kN
 minus clamping force = 2,0 kN

 arithmetic machining force ≤ 2,4 kN
 perm. machining force max. ≤ 2,0 kN

NOTE:

The permissible supporting forces in the diagram are static. Vibrations occurring during the machining could be far higher. For these cases, a large reserve must be included.

SET SCREWS:

Support elements must never be operated without set screws, since penetrating dirt and cooling water impair the function. Most support elements are fitted with a set screw as standard.

When using special set screws, make sure that the set screws are tempered and designed slightly ball-shaped. Set screws with a tip or fluting should not be used. Special set screws can jeopardise the function of return stroke of the support pin and the spring-loaded system. During in-house production, please manufacture according to our specifications.

No. 6961F/L

Support Element, block type

spring advanced or air advancing,
max. operating pressure 400 bar,
min. operating pressure 50 bar.

65300	6961L-20	440	20	10	13,0	4,90	3100

*Article No. 6961F-**: Contact force F1 dependent on spring pretensioning and setting travel.

Article No. 6961L-**: Contact force F1 dependent on air pressure at max. 10 bar.

Design:

Cylinder body from steel, burnished. Support pin case hardened and ground. Internal locking sleeve system Kostyrka. Special wiper prevents contamination. Support pin with internal thread. Home position retracted or extended, depending on function. Internal parts from stainless steel. Oil supply via threaded connection or oil channel in the fixture body.

Application:

Support element no. 6961F-**: Plunger extended, spring adjustable contact force.

Support element no. 6961L-**: Plunger retracted, pneumatic advance spring return.

These spring or pneumatic advancing hydraulic support elements provide additional support to avoid vibration or deflection during machining. Even large workpiece tolerances can be compensated (castings). Fitted directly below a clamping point they prevent distortion of the workpiece. The support elements can be matched with clamping cylinders of same nominal size into one circuit. To prevent the support plunger from possible slackening during a clamping procedure, it is advisable to connect a sequence valve (no. 6918-2) to control the support elements. Due to this fact, the support element is locked before the clamping procedure can be activated (fig. 1). Being used as an additional support to prevent from bending and vibration, the element should be preceded by a sequence valve (no. 6918-2) in order to ensure supporting before clamping. In case the clamping force is higher than the support force, the clamping force has to be reduced by using a pressure reducing valve no. 6917 (fig. 2).

Features:

High resilience due to high operating pressure, matched to the forces of the clamping cylinder row. Smooth contacting of the workpiece by adjustable spring or pneumatic pressure. Universal use in each position.

Easy attachment of thrust pieces in the piston rod thread.

Note:

For spring advanced types, there is risk of sucking in coolant! To avoid this, a breather hose has to be connected to the pneumatic port and moved to a protected area. Support pin must be protected against the entry of dirt and splash water by fitting a set screw or plug. The support elements must be properly vented! The vent port must always be on top. Failure to do so can cause destruction of the clamping element by the escaping diesel.

The supporting force should be matched to the clamping force in order to absorb machining forces.

The supporting force should always be at least twice as high as the clamping force.

*Article No. 6962F-**: Contact force F1 dependent on spring pretensioning and setting travel.
Article No. 6962L-**: Contact force F1 dependent on air pressure at max. 10 bar.

Design:

Cylinder body from steel, burnished. Support pin case hardened and ground. Internal locking sleeve system Kostyrka. Special wiper prevents contamination. Support pin with internal thread. Home position retracted or extended, depending on function. Internal parts from stainless steel. Oil supply via oil channel in fixture body.

Application:

Support element no. 6962F-**: Plunger extended, spring adjustable contact force.
Support element no. 6962L-**: Plunger retracted, pneumatic advance spring return.
These spring or pneumatic advancing hydraulic support elements provide additional support to avoid vibration or deflection during machining. Even large workpiece tolerances can be compensated (castings). Fitted directly below a clamping point they prevent distortion of the workpiece. The support elements can be matched with clamping cylinders of same nominal size into one circuit. To prevent the support plunger from possible slackening during a clamping procedure, it is advisable to connect a sequence valve (no. 6918-2) to control the support elements. Due to this fact, the support element is locked before the clamping procedure can be activated (fig. 1, page 96). Being used as an additional support to prevent from bending and vibration, the element should be preceded by a sequence valve (no. 6918-2) in order to ensure supporting before clamping. In case the clamping force is higher than the support force, the clamping force has to be reduced by using a pressure reducing valve no. 6917.

Features:

High resilience due to high operating pressure, matched to the forces of the clamping cylinder row. Smooth contacting of the workpiece by adjustable spring or pneumatic pressure. The threaded type allows the supporting element to be accommodated in fixtures in a space-saving manner. Easy attachment of thrust pieces and/or thrust bolts in the piston rod thread.

Note:

For spring advanced types, there is risk of sucking in coolant! To avoid this, a breather hose has to be connected to the pneumatic port and moved to a protected area. Support pin must be protected against the entry of dirt and splash water by fitting a set screw or plug. The support elements must be properly vented! The vent port must always be on top. Failure to do so can cause destruction of the clamping element by the escaping diesel.

The supporting force should be matched to the clamping force in order to absorb machining forces.

The supporting force should always be at least twice as high as the clamping force.

66910	6964F-55	49 - 71	55,6	19,0	4,26	4291

Design:

Cylinder body from steel, hardened. Support pin with internal thread case hardened and ground. Wiper to protect against dirt and cooling water. Internal parts from stainless steel. Oil supply via threaded port.

Application:

The support element is used as an extra support to prevent sagging and vibration of a workpiece.

Features:

Element with high load capacity and low height. Spring extension: the plunger is normally extended. Variable spring setting permits sensitive adjustment of contact force.

Note:

Support pin must be protected against the entry of dirt and splash water by fitting a set screw or plug. When placing into operation, ensure that all air is bled from the system. Failure to do so can cause destruction of the clamping element by the escaping diesel effect.

The supporting force should be matched to the clamping force in order to absorb machining forces.

The supporting force should always be at least twice as high as the clamping force.

* Contact force with max. 1.7 bar air pressure.

Design:

Cylinder body from steel, hardened. Support pin with internal thread case hardened and ground. Wiper to protect against dirt and cooling water. Internal parts from stainless steel. Oil supply via threaded port.

Application:

The support element is used as an extra support to prevent sagging and vibration of a workpiece.

Features:

Element with high load capacity and low height. Pneumatic: the plunger is normally retracted. Sensitive adjustment of contact force by varying the air pressure.

Note:

Support pin must be protected against the entry of dirt and splash water by fitting a set screw or plug. When placing into operation, ensure that all air is bled from the system. Failure to do so can cause destruction of the clamping element by the escaping diesel effect.

The supporting force should be matched to the clamping force in order to absorb machining forces.

The supporting force should always be at least twice as high as the clamping force.

325878	6964H-17-3	26,5 - 53,5	17	12,5	2,13	10,5	1920

Design:

Cylinder body from steel, hardened. Support pin with internal thread case hardened and ground. Wiper to protect against dirt and cooling water. Internal parts from stainless steel. Oil supply via threaded port.

Application:

The support element is used as an extra support to prevent sagging and vibration of a workpiece.

Features:

Element with high load capacity and low height. Hydraulic and spring: the plunger is normally retracted. When pressure is applied, the support pin advances with a weak spring-applied force to contact the workpiece. The spring force varies with the stroke. As the hydraulic pressure rises, the support plunger is hydraulically clamped. When the pressure is released, the support plunger returns to the retracted position. Very high repeatability ensures optimum production quality.

Note:

Support pin must be protected against the entry of dirt and splash water by fitting a set screw or plug. When placing into operation, ensure that all air is bled from the system. Failure to do so can cause destruction of the clamping element by the escaping diesel effect.

The supporting force should be matched to the clamping force in order to absorb machining forces.

The supporting force should always be at least twice as high as the clamping force.

567071	6964H-36-5	18,0 - 57,8	35,6	15,8	2,13	9,34	1275

Design:

Cylinder body from steel, hardened. Support pin with internal thread case hardened and ground. Wiper to protect against dirt and cooling water. Internal parts from stainless steel. Oil supply through threaded connection or an O-ring connection on the underside.

Application:

The support element is used as an extra support to prevent sagging and vibration of a workpiece.

Features:

Element with high load capacity and low height. Oil pressure: The plunger is retracted in the normal position. When pressure is applied, the support pin advances with a weak spring-applied force against the inserted workpiece. The spring force varies with the pin stroke. As the hydraulic pressure rises, the support pin is hydraulically clamped. When the pressure is released, the support pin returns to the normal position. Very high repeatability ensures optimum production quality. The basic body can be removed for direct installation of the screw-in cartridge.

Note:

Support pin must be protected against the entry of dirt and splash water by fitting a set screw or plug. When placing into operation, ensure that all air is bled from the system. Failure to do so can cause destruction of the clamping element by the escaping diesel effect. Connections P1, P2 and the O-ring connection are all connected. Each can be used as an oil connection. **To achieve a controlled clamping sequence, there is the option of screwing the sequence valve 6918-XX-XXX directly into threaded connection P1.** The surface finish of the O-ring connection must be Rz 6.3 and flatness must be 0.08.

To be able to absorb machining forces, the supporting force should be matched to the clamping force. The supporting force should always be at least twice as high as the clamping force.

567074	6964HS-18-1	13,5 - 44,5	17,8	6,5	2,13	3,3	70	290
567075	6964HS-18-10	13,5 - 44,5	17,8	12,5	2,13	3,7	70	327

Design:

Cylinder body from steel, hardened. Support pin with internal thread case hardened and ground. Wiper to protect against dirt and cooling water. Internal parts from stainless steel. Oil supply via threaded port.

Application:

The support element is used as an extra support to prevent sagging and vibration of a workpiece. Also confirms the presence of a workpiece, also on uneven surfaces such as castings.

Features:

The piston is retracted into its basic position while an air flow passes through the support element. When pressure is applied, the support pin advances with a weak spring-applied force against the inserted workpiece. This closes the integrated air valve to indicate that the workpiece is present and is in contact. The maximum air operating pressure is 1 bar. Then the support pin is clamped hydraulically. When the pressure is released, the support pin returns to the normal position. Very high repeatability ensures optimum production quality. Element with high load capacity and low height.

Note:

Support pin must be protected against the entry of dirt and splash water by fitting a set screw or plug. When placing into operation, ensure that all air is bled from the system. Failure to do so can cause destruction of the clamping element by the escaping diesel effect.

To be able to absorb machining forces, the supporting force should be matched to the clamping force.

The supporting force should always be at least twice as high as the clamping force.

567079	6964HS-18-50	13,5 - 44,5	17,8	12,5	2,13	3,7	70	607

Design:

Cylinder body from steel, hardened. Support pin with internal thread case hardened and ground. Wiper to protect against dirt and cooling water. Internal parts from stainless steel. Oil supply through threaded connection or an O-ring connection on the underside.

Application:

The support element is used as an extra support to prevent sagging and vibration of a workpiece. Also confirms the presence of a workpiece, also on uneven surfaces such as castings.

Features:

The piston is retracted into its basic position while an air flow passes through the support element. When pressure is applied, the support pin advances with a weak spring-applied force against the inserted workpiece. This closes the integrated air valve to indicate that the workpiece is present and is in contact. The maximum air operating pressure is 1 bar. Then the support pin is clamped hydraulically. When the pressure is released, the support pin returns to the normal position. Very high repeatability ensures optimum production quality. Element with high load capacity and low height. The basic body can be removed for direct installation of the screw-in cartridge.

Note:

Support pin must be protected against the entry of dirt and splash water by fitting a set screw or plug. When placing into operation, ensure that all air is bled from the system. Failure to do so can cause destruction of the clamping element by the escaping diesel effect.

Connections P1, P2 and the O-ring connection are all connected and each can be used as an oil connection. **To achieve a controlled clamping sequence, there is the option of screwing the sequence valve 6918-XX-XXX directly into threaded connection P1.** The surface finish of the O-ring connection must be Rz 6.3 and flatness must be 0.08.

To be able to absorb machining forces, the supporting force should be matched to the clamping force.

The supporting force should always be at least twice as high as the clamping force.

Dynamic pressure monitoring:

No. 6965-10

Compensating collet

Single-acting, with spring return, max. operating pressure 250 bar, min. operating pressure 30 bar.

Order no.	Article no.	max. clamping force [kN]	max. locking force [kN]	max. piston force [kN]	Holding force [kN]	Clamping stroke [mm]	Compensating stroke [mm]	Workpiece clamping range [mm]	G	OR-1 O-ring Order No.	Weight [g]
562219	6965-10	2,5	5	2,8	0,34	7,5	3,75	2,5 - 8,5	G1/8	550265	1900

Design:

Housing made of steel, burnished. Complete with four fastening bolts and O-ring for flange seal. Oil supply via threaded connection or oil channel in the fixture body. Clamping lever standard is not supplied as standard.

Application:

The compensating collet is used in clamping devices to clamp or hold workpieces floating and distortion-free. Several compensating collets can be used without distorting the workpiece.

Features:

The clamp arms mounted axially above the pivot point each have a counterbalance stroke. This allows workpieces with large deviations in shape and position to be clamped on the clamping surface in the stroke direction. The workpieces are supplied by application of pressure first at connection A „clamping“, by placing the clamping lever onto the workpiece and then to clamp the clamping lever distortion-free in position by means of connection B „clamping“. The clamping sequence can also be implemented by means of a sequence valve 6918-80-10 or sequence valve 6918-XX. The clamping levers are changeable. Compression pieces are available on request.

Note:

Before operating the compensating collet, the workpiece must be clamped to prevent it from moving.

Subject to technical alterations.

Always observe clamping pressure

Subject to technical alterations.

No. 6966

Clamping tongs

Single-acting,
max. operating pressure 250 bar,
min. operating pressure 30 bar.

Order no.	Article no.	Holding force at 250 bar [kN]	Piston force at 250 bar [kN]	Stroke H min. [mm]	Stroke H max. [mm]	Clamping range S [mm]	Md [Nm]	OR-1 O-ring Order No.	Weight [g]
562215	6966-01	0,78	1,25	1,8	14	2 - 10	10	466334	1423

Design:

Housing made of steel, burnished. Steel clamping lever, case-hardened. The clamping levers are driven by two single-acting threaded cylinders. Oil supply via oil channel in fixture body. Supplied as standard with oil feed brake and four fastening bolts M6 x 70. A filter insert with an O-ring is integrated in the supply.

Application:

The clamping tongs prevent vibrations on the workpiece during machining. The clamping tongs are suitable for holding the workpieces but not for positioning them.

Features:

The clamping tongs hold the workpiece without clamping it. A wide range of clamping forms can be implemented with the clamping lever blank.

Note:

Resetting of the clamping levers by the oil feed brake. Resetting is also possible via a spring, which is not supplied as standard.

Drilling template device:

Application example:

(with spring advance return)

No. 6966D

Clamping tongs

Double-acting,
max. operating pressure 250 bar,
min. operating pressure 30 bar.

CAD

Order no.	Article no.	Holding force F at 250 bar * [kN]	Piston force at 250 bar [kN]	Clamping range up to [mm]	OR-1 O-ring Order No.	Md [Nm]	Weight [g]
562217	6966D-07	6,7	7,8	10	298778	25	3350

* Holding force specification for lever length 0

Design:

Housing made of steel, burnished. Clamp lever holder made of case-hardened steel. The clamping lever holder is driven by two piston rods installed in the housing. Oil supply via oil channels in fixture body. Supplied as standard with four fastening bolts M8 x 80 and two Viton moulded seals for the fastening bolt holder.

Application:

The clamping tongs prevent vibrations on the workpiece during machining. The clamping tongs are suitable for compensating and holding the workpieces but not for positioning them, with a repetition accuracy of 0.02 to 0.03 mm.

Features:

The clamping tongs hold the workpiece without clamping it.

Note:

The clamping levers can be designed individually, these are not supplied as standard.

Drilling template device:

Application example:

Holding force table for different lever lengths:

Operating pressure	bar	100						
Lever length L	mm	0	20	40	60	80	100	
Holding force horizontal F	kN	2,49	1,49	1,05	0,82	0,68	0,57	
Operating pressure	bar	200						
Holding force horizontal F	kN	4,97	2,96	2,11	1,69	1,35	1,15	

Subject to technical alterations.

No. 6966R

Clamping lever blank

CAD

Order no.	Article no.	Span H max. [mm]	A	B	C	E	Weight [g]
562216	6966R-01-00	8	61	24	15	52	559

Design:

Case-hardened steel, burnished.

Application:

For clamping tongs 6966-01. The clamping lever blank can be adjusted according to the shape of the workpiece.

Note:

The span H can be increased as required, but it must be noted that shear forces of more than 8 mm can occur!

No. 6966DF

Filter plate

CAD

Order no.	Article no.	max. pressure range [bar]	Filtration [µm]	OR-1 O-ring Order No.	Weight [g]
562218	6966DF-07-100	250	100	466334	320

Design:

Filter plate and filter sleeve made of aluminium, black anodised.
Filter plates made of metal mesh.

Application:

Used to protect the 6966D-07 clamp from contamination in clamping devices

Note:

If a finer strainer is required, this can be easily replaced.
The finer the filter selected, the greater the flow resistance.

Replacement filter:

- Filter, plug-in design 25 µm, order no. 562203
- Filter, plug-in design 40 µm, order no. 562204
- Filter, plug-in design 100 µm, order no. 562205

Drilling template device:

Subject to technical alterations.

Cl = clamping, Rel = release, ending of item no.: -21 = dual-action, right-pivoting / -22 = dual-action, left-pivoting
* details with clamp arm, standard (6951)

Design:

Cylinder barrel made of steel, hardened and burnished. Piston rod nitrided. Piston rod with internal thread. O-ring for flange seal. Wiper at the piston rod. Clamp arm not supplied as standard. Oil supply via threaded connection or oil channel in the fixture body.

Application:

The swivel clamp is used in fixtures in which the workpiece must be freely accessible and inserted from above. Even workpieces with difficult shapes can be clamped using special clamp arms (available on request).

Features:

The swing motion is executed via three ball guides, thereby increasing positioning accuracy, repeat accuracy and service life.

Note:

The piston stroke is executed with spheres, so volume flow Q max. must be complied with. Clamping arm length and clamping arm weight must be strictly observed. No force may be applied to the piston when mounting accessories to it. To equalise height differences on the workpiece, the vertical clamping path must be 50% of the clamping stroke. When placing into operation, ensure that all air is bled from the system. To throttle the oil feed, the throttle/check valve no. 6916-12-01 for G1/8 can optionally be used. **To achieve a controlled clamping sequence, there is the option of screwing the sequence valve 6918-XX-XXX directly into the threaded connection.** Other swivel angles are available on request.

Formula to determine the total mass moment of inertia and the volume flow:

total mass moment of inertia Jtotal. [kgm²]

Clamp arm mass moment of inertia JH [kgm²]

Piston mass moment of inertia JK [kgm²]

Clamp arm load mH [kg] Centre of gravity distance Ls [m]

Jtotal. = JK + JH + mH x Ls² [kgm²]

Volume flow Qmax. [cm³/s]

Volume clamp Vol.cl [cm³]

Minimum permitted clamp time tmin. [s]

Qmax. = Vol.sp / tmin. [cm³/s]

Suitable clamp arms are 6951-XX.

Code of types:

Type 21 = double acting, right swinging
 Type 22 = double acting, left swinging

Positioning:

Positioning hole for clamp arm:

threaded stud
size 03 - 09

threaded stud
size 11

Swing directions:

positioning hole for clamp arm (6x60°)

● = Standard type
 ○ = Special type

Sp = clamp, Lo = unclamp

Design:

Cylinder housing made of steel. Piston and pivot bolts are made from tempered steel, hardened and nitrided. Metal wiper to protect the dirt wiper is integrated into the housing. Supply scope includes hinge pins, tension plates, fastening screws but not clamping levers. The threaded connections are suitable for restrictor check valves no. 6916-12-XX. **To achieve a controlled clamping sequence, there is the option of screwing the sequence valve 6918-XX-XXX directly into the threaded connection.** Oil supply via threaded connection or oil channel in the fixture body.

Application:

Link clamps are used in clamping fixtures in which workpieces must be freely accessible and loaded from above. Particularly suitable for clamping in clamping pockets.

Features:

Top flange version, the horizontal centre axis at the standard lever and the pressure point on the workpiece lie in one plane. This prevents relative movement on the workpiece.

Note:

Maximum travel speed 0.5 m/s. The volumetric flow can be regulated via a restrictor check valve

The B to C leverage on the clamping levers is 1 to 1.5!

In the design of blank levers, deviations which lead to higher clamping forces are permitted only in exceptional cases. For sizes 32 and 45, screws with strength class 12.9 must be used.

Installation direction of the clamping arm:

Design:

Hardened, tempered and burnished steel. Supplied with compression screw.

Application:

For link clamp 6942KK.

Note:

Clamping pressure, leverage, flow volume and clamp arm weight must always be observed.

No. 6942KR-xx-14

Clamping arm blank

Design:

Hardened, tempered and burnished steel.

Application:

For link clamp 6942KK.

Note:

Clamping pressure, leverage, flow volume and clamp arm weight must always be observed.

Formula to determine the clamping force F1:

Clamping force = F1 [kN], piston force = F5 [kN], operating lever = B [mm], load lever = C [mm]
 $F1 = F5 \times B / C$

Subject to technical alterations.

LOW PRESSURE SUPPORT ELEMENTS - TECHNICAL INFORMATION

OPERATING PRESSURE:

To achieve a guaranteed clamping function, the min. operating pressure must not be fallen below. The highest clamping force is achieved at max. operating pressure.

CONTACT FORCE:

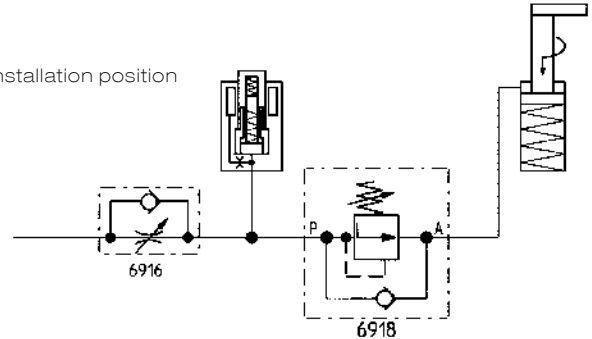

The spring-loaded contact force is at its greatest at a min. distance between the installation position and workpiece.

SHEAR FORCES:

Support elements only absorb forces in axial direction of the piston. If shear forces occur, the support element is damaged. The function of the support element can no longer be guaranteed.

VOLUME FLOW:

The permissible volume flow must not be exceeded. The permitted volume flow can be controlled with a throttle/check valve. If the volume flow is too high, the oil pressure increases so quickly that the anchor is clamped before it is on the workpiece. If several support elements are used, the permissible volume flow is the total of the individually permissible volume flows.

ELASTIC CHANGE IN LENGTH:

Just like any steel component, the support elements also have an elastic behaviour. During heavy loading, a setting behaviour occurs.

VENTING:

Support elements only need a very small oil volume. Since the hydraulic oil in the connection line hardly moves, careful venting is necessary. Air in the oil can prolong the clamping time considerably. If venting is not carried out properly, a diesel effect may occur and destroy the support element. Always vent at low pressure.

DIESEL EFFECT:

If petroleum containing air bubbles is compressed very quickly, the bubbles will be heated so strongly that a self-ignition of the air/gas mixture could occur. As a result, a very high pressure and temperature increase occurs locally, which could also damage seals as well as cause accelerated ageing of the oil.

SPRING SPACE VENTILATION:

The free loading and venting of the spring spaces must be ensured. The pressure connection must be protected or arrayed properly so no coolant is taken in. Failure to observe this can lead to malfunctions.

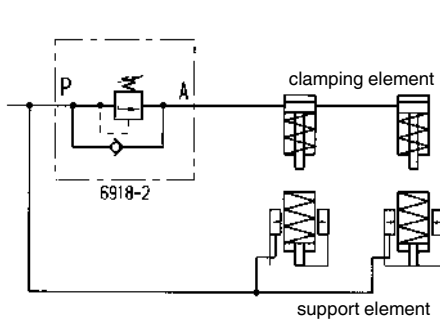

COOLANT AND SHAVINGS:

Support elements should normally be protected against shavings and cooling water.

CONTROLLING THE CLAMPING SEQUENCE:

The sequence of supports and clamps must be controlled time-dependent or pressure-dependent. This can be done using a sequence valve 6918 or supply valve 6918-80-10.

PRESSURE REDUCTION OF THE CLAMPING ELEMENTS:

The pressure in the clamping circuit is reduced with a pressure control seat valve 6917.

SUPPORTING FORCE:

The permissible loading force of support elements must always be regulated so that the clamping force of the clamping elements used and the static and dynamic machining forces can be absorbed safely. Permissible loading force minus clamping force minus safety reserve results in the possible machining force.

If the total number of occurring forces exceeds the permissible loading force, the anchor of the support element will be pressed backwards thereby damaging the support element.

The supporting force should always be at least twice as high as the clamping force.

COMBINATIONS OF SUPPORT ELEMENT WITH LINK CLAMP

Example of support element 6944KH-04-2 and link clamp 6942KK-32 with standard clamping arm

	min. operating pressure [bar]	max. operating pressure [bar]	max. supporting force [kN]	Clamping force at 70 bar [kN]	Clamping force at 38 bar [kN]
support element	25	70	4,0	-	-
link clamp	15	100	-	3,71	2,0

POSSIBLE MACHINING FORCE AT 70 BAR:

perm. loading force = 4,0 kN
 minus clamping force = 2,0 kN

 arithmetic machining force ≤ 2,0 kN
 perm. machining force max. ≤ 2,0 kN

NOTE:

The clamping pressure for the link clamp 6942KK must be reduced to approx. 38 bar. The permissible supporting forces in the diagram are static. Vibrations occurring during the machining could be far higher. For these cases, a large reserve must be included.

SET SCREWS:

Support elements must never be operated without set screws, since penetrating dirt and cooling water impair the function. Most support elements are fitted with a set screw as standard.

When using special set screws, make sure that the set screws are tempered and designed slightly ball-shaped. Set screws with a tip or fluting should not be used. Special set screws can jeopardise the function of return stroke of the support pin and the spring-loaded system. During in-house production, please manufacture according to our specifications.

No. 6944KH

Support Element, top-flange-mounting

Normally retracted. Hydraulic advanced. Spring force for contact, max. operating pressure 70 bar, min. operating pressure 25 bar.

559183	6944KH-10-5	7,9 - 13,6	10,0	10,0	1,8	30,0	2,5	1029

Design:

Body made from steel, tempered and burnished. Support pin with internal thread case hardened and ground. Wiper to protect against dirt and cooling water. Oil supply via threaded connection or oil channel in the fixture body.

Application:

The support element is used as an extra support to prevent sagging and vibration of a workpiece.

Features:

Element with high load capacity and low height. Oil pressure: The plunger is retracted in the normal position. When pressure is applied, the support pin advances with a weak spring-applied force against the inserted workpiece. The spring force varies with the pin stroke. As the hydraulic pressure rises, the support pin is hydraulically clamped. When the pressure is released, the support pin returns to the normal position. Very high support force ensures optimum manufacturing quality.

Note:

The support pin must be protected against the entry of dirt and splash water by a set screw. When putting into operation, make sure that the hydraulic system is vented perfectly. Failure to do so can cause destruction of the clamping element by the escaping diesel effect. The vent hole must be connected. No coolant must be sucked through this.

The supporting force should be matched to the clamping force in order to absorb machining forces.

The supporting force should always be at least twice as high as the clamping force.

Pressure Reducing Valve

for O-ring connection,
max. operating pressure 400 bar,
min. operating pressure 40 bar.

Order no.	Article no.	NG	Input pressure at P max. [bar]	Adjust. pressure at A min. [bar]	Adjust. pressure at A max. [bar]	Q [l/min]	OR-1 O-ring Order No.	Weight [g]
69179	6917-1	6	400	20	370	5	161810	1085

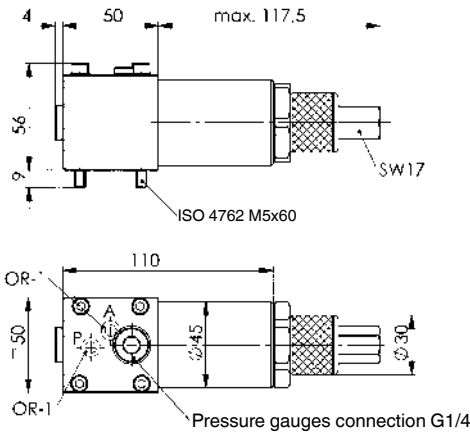

Design:

Cylinder body made of steel, phosphatized. Remaining parts made of tempering steel. Valve seat and piston are hardened and ground. This valve is leak free.

Application:

The stop valve shuts the flow from P to A when the pressure set A is reached. It opens when the pressure at A falls below the set value (e.g. through leakage).

1. Single-circuit system: The pressure reducing valve is used in a hydraulic circuit, where part of the cylinders are only to receive a reduced pressure (e.g. to prevent distortion of the workpieces or for positioning).
2. Dual-circuit system: If two working circuits are to be operated with different pressures from a single pump unit, the pressure of one circuit must be reduced by inserting a pressure reducing valve.

See hole pattern below!

No. 6917A-1

Connecting Plate

for pressure reducing valve.

Order no.	Article no.	L x W x H	Connection	Weight [g]
69211	6917A-1	50 x 50 x 25	G1/4	450

Design:

Tempering steel, phosphatized.

Application:

For pipe connection of pressure reducing valve No. 6917-1.

Hole pattern shape A nominal size 6 according to DIN 24340 T2:

Subject to technical alterations.

No. 6917R
Pressure control seat valve

for pipe fitting G1/4,
max. operating pressure 500 bar,
min. operating pressure 40 bar.

Order no.	Article no.	Input pressure at P max. [bar]	Adjust. pressure at A min. [bar]	Adjust. pressure at A max. [bar]	Q [l/min]	DI-1 Seal Order No.	Return line press. at T [bar]	Weight [g]
326405	6917R-5-130	500	8	130	5	407205	≤ 20	1860
326421	6917R-5-380	500	30	380	5	407205	≤ 20	1860

Design:

Leak-oil-free 3-way pressure regulating valve as piping valve in seat design, directly actuated. With additional oversteer compensation (integrated pressure-limitation function).

The valve mainly consists of three parts:

the valve accommodating body with the P, T and A connections in G ¼, the clamp-in valve with inlet filtering and the additional filter element in the A-channel.

P is the inlet and A is the outlet of the valve. T is the tank connection and must be discharged to the tank separately or in a common line.

Application:

The pressure regulating valve is normally open.

With changing, higher input pressure, it maintains the output pressure largely constant. As soon as the set pressure is reached at the consumer, the valve closes and is leak-proof.

If the pressure between the valve output and the consumer rises above the set overload value, the excess pressure is reduced over the third connection (T-connection).

The valve can be used in front of a directional control valve in the P-channel or behind a directional control valve in the A and/or B-channel.

Features:

The controlled pressure and overload pressure are set simultaneously with an adjusting screw. The overload pressure is always about 10 bar above the regulation pressure.

Protection against outside force and puncturing of the valve.

The valve flow regulates P to A.

The inlet P and outlet A are each protected against coarse contamination by a filter element with the nominal filter mesh of 100 µm.

The pressure regulating function is avoided in the opposite direction (from A to P).

Pressure is adjusted with an adjusting screw.

To set and read the pressure, a pressure display device must be installed at the valve outlet.

The pressure setting can be sealed.

Note:

Observe mounting instructions.

Replacement part: filter insert, Order No. 326678

No. 6917F

Pressure control seat valve

for O-ring connection,
max. operating pressure 500 bar,
min. operating pressure 40 bar.

Order no.	Article no.	NG	Input pressure at P max. [bar]	Adjust. pressure at A min. [bar]	Adjust. pressure at A max. [bar]	Q [l/min]	Return line press. at T [bar]	DI-1 Seal Order No.	OR-1 O-ring Order No.	Weight [g]

326785	6917F-3-380	6	500	30	380	12	≤ 20	407205	493478	2100

Design:

Leak-oil-free 3-way pressure regulating valve as flange valve in seat design, directly actuated.

With additional oversteer compensation (integrated pressure-limitation function).

The valve mainly consists of three parts:

the spacer plate with the standard hole pattern of NG 6, CETOP 3, the reversing plate and the clamp-in valve. The clamp-in valve is seated in the reversing plate in the P-channel. The oil flow is redirected from the valve inlet P1 to the valve outlet P2 to A.

The channels P, T and A must always be present on the opposite flange surface.

The dimensions are recorded in the standards DIN 24340-Form A, CETOP R 35 H and ISO 4401.

Application:

The pressure regulating valve is normally open.

With changing, higher input pressure, it maintains the output pressure largely constant. As soon as the set pressure is reached at the consumer, the valve closes and is sealed leak-proof.

If the pressure between the valve output and the consumer rises above the set overload value, the excess pressure is reduced over the third connection (T-connection).

The valve can be used in front of a directional control valve in the P-channel or behind a directional control valve in the A and/or B-channel.

Features:

The controlled pressure and overload pressure are set simultaneously with an adjusting screw. The overload pressure is always about 10 bar above the regulation pressure.

Protection against outside force and puncturing of the valve.

The valve flow regulates P1 to P2.

The inlet P1 is protected against coarse contamination by a filter element with the nominal filter mesh of 100 µm.

In the opposite direction (from P2 to P1), the valve can be flowed through freely.

To set and read the pressure, a pressure display device must be installed at the valve outlet.

Pressure is adjusted with an adjusting screw.

The pressure setting can be sealed.

Note:

Observe mounting instructions.

Design:

Leak-oil-free 2-way or 3-way pressure regulating valve as clamp-in valve in seat design, directly actuated. For the 3-way pressure regulating valve, with additional oversteer compensation (integrated pressure-limitation function).
Screw-in thread M24 x 1.5.

Application:

The pressure regulating valve is normally open. With changing, higher input pressure, it maintains the output pressure largely constant. As soon as the set pressure is reached at the consumer, the valve closes and is sealed leak-proof. If the pressure between the valve output and the consumer rises above the set overload value, the excess pressure is reduced over the third connection (T-connection). The valve can be used in front of a directional control valve in the P-channel or behind a directional control valve in the A and/or B-channel. The additional tank connection for the 3-way valve must always be planned.

Features:

For the 3-way valve, the controlled pressure and overload pressure are set simultaneously with an adjusting screw. The overload pressure is always about 10 bar above the regulation pressure. Protection against outside force and puncturing of the valve.

The valve flow regulates P to A. The inlet P is protected against coarse contamination by a filter element with the nominal filter mesh of 100 µm. In the opposite direction at the valve (from A to P), the valve can be flowed through freely. To set and read the pressure, a pressure display device must be installed at the valve outlet. Pressure is adjusted with an adjusting screw. The pressure setting can be sealed.

Note:

Observe mounting instructions.

320143	6918-5	30	500	20	P-A	-40 - +80	10-500	173096	750

Design:

Steel body, nitrided. Sealing nut galvanized. All functional components hardened and ground. For sequence valve 6918-3 and 6918-12, the oil is supplied via conduits drilled in the clamping device. The following valves are required for combining several sequence valves:

- 6918-3 inlet valve
- 6918-4 series valve
- 6918-5 end-of-line valve

The oil is supplied via a threaded connection.

Application:

The pressure sequence valve is used in cases where another consumer is connected to the circuit after a set pressure has been reached. If several sequence valves are employed in the circuit, please note that the pressure in this circuit always adjusts to the last pressure stage.

For this type, the switching pressure remains largely constant, regardless of the outflow pressure on the outlet side (cylinder side).

Note:

During disassembly of the pressure control valve, first loosen SW 24 then SW 22. Installation is carried out in reverse order with the specified tightening torque. Increasing the preload of the compression spring by turning the slotted screw results in a greater pressure difference between P and A. The fastening bolts are not supplied as standard.

Application example:

Hydraulic diagram:

Preferably perform sequential control in parallel.

Design:

Housing from steel, hardened and burnished.

Application:

The sequence valve is used in cases where another consumer is connected to the circuit after a set pressure has been reached. The sequence valve ensures a controlled clamping sequence. Once a defined pressure is reached, another hydraulic circuit is opened.

Note:

The sequence valve can be screwed directly into the threaded connection for the swing clamp top flange and base flange types 6951KP, 6951FP, 6941KP and link clamp 6942KK, and with support elements for flange design 6964H and 6964HS. The oil must be supplied via the O-ring connection. The sequence valve can be screwed directly into fixtures as well.

320366	6918-2-02-02	30	500	20	P-A	-40 - +80	10-500	150

Design:

Steel housing, nitrided. Sealing nut galvanized. All functional components hardened and ground. Balls out of roller bearing steel.

Application:

The pressure sequence valve is used where another hydraulic system or another consumer should be activated after achieving a specified pressure. If a circuit is designed with several sequence valves, it must be observed that the pressure in this circuit is always adjusted in the last respective pressure stage. The switching pressure for this type, irrespective of the pressure on the output side (consumer side) remains largely constant.

Note:

For disassembly of the pressure valve please release first SW (AF) 24, then SW 22. For assembly please use reverse sequence and observe max. seating torque. The pressure difference between P and A depends on the preload of the adjustment spring.

Installation dimensions:

No. 6918-10

Pressure Relief Valve

for pipeline installation

Order no.	Article no.	min. operating pressure [bar]	max. operating pressure [bar]	max. pressure in T [bar]	Q [l/min]	Ambient temp. [°C]	Viscosity [cSt]	Weight [g]
288225	6918-10-001	30	160	20	20	-40 - +80	10-500	200
65375	6918-10	100	500	500	20	-40 - +80	10-500	200

Design:

For 6918-10-001 housing made of zinc, for 6918-10 housing made of ductile iron. Control piston made of steel, hardened. Can be sealed on setting spindle.

Application:

The pressure relief valve is used to protect against exceeding the maximum permissible pressure for the system (safety valve) or to limit operating pressures. Once the set pressure is reached, the valve opens, the excess liquid in the system flows back into the tank via the T line of the pressure relief valve. The pressure relief valve is not suitable for the protection of pressure equipment as defined by the PED 97/23 / EC.

Diagram:

*** The duration of the delay can vary, depending on the viscosity of the oil in the application. This statement is valid with ISO 32 Oil.

Design:

Delay valve with NG 6. The hole pattern is not standardised. Valve housing made of steel, interior parts made of stainless steel. The fastening bolts M6x60 (order no. 115634) are not supplied as standard. Oil supply via oil channel in fixture body.

Application:

With this valve, unclamping of selected components can be delayed during the release process. The delay can be achieved within a circuit. A parallel circuit with several delay valves is possible.

Features:

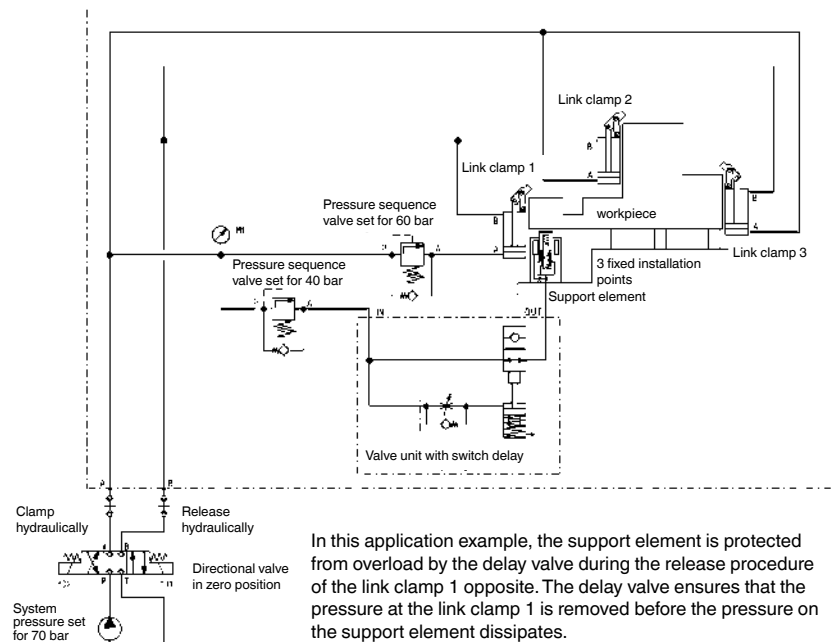

In the release process, hydraulic clamping and support elements or workpieces can be protected from overload. The consumers can be selectively controlled through a controlled sequence of the pressure reduction in the clamping circuit.

Note:

Observe installation instructions with construction notes for the fixture manufacturer. The flange surface of the fixture must have an evenness of 0.08 and a surface quality of Rz 6.3.

Application example:

Subject to technical alterations.

No. 6918-110

Delay valve

For pipeline connection, for the release clamping circuit, max. operating pressure 350 bar, min. operating pressure 35 bar.

CAD

Order no.	Article no.	Setting range *** for the delay [s]	Q max. [l/min]	Filter mesh [µm]	Weight [g]

*** The duration of the delay can vary, depending on the viscosity of the oil in the application. This statement is valid with ISO 32 Oil.

Design:

Valve housing made of steel, interior parts made of stainless steel. The fastening bolts M6x50 (order no. 448456) are not supplied as standard. Oil supply via threaded connection G 1/4.

Application:

With this valve, unclamping of selected components can be delayed during the release process. The delay can be achieved within a circuit. A parallel circuit with several delay valves is possible.

Features:

In the release process, hydraulic clamping and support elements or workpieces can be protected from overload. The consumers can be selectively controlled through a controlled sequence of the pressure reduction in the clamping circuit.

Note:

Observe installation instructions with construction notes for the fixture manufacturer.

Application example:

In this application example, the support element is protected from overload during release by the delay valve during the release procedure of the swing clamp opposite. The delay valve ensures that the pressure at the swing clamp is removed before the pressure on the support element dissipates.

Subject to technical alterations.

No. 6918-80-10

Sequence valve

for O-ring joint, Pressure-time delayed, max. operating pressure 250 bar, min. operating pressure 40 bar.

Order no.	Article no.	Q [l/min]	Delay setting range [s]	Direction of flow	OR-1 O-ring Order No.	Weight [g]
326280	6918-80-10	8	1-10	P-A	161810	1500

Design:

Cylinder body made of steel, burnished. Connection diagram, NW 5, is not standardised. Hardened control piston and check valve. Oil supply takes place through drilled channels in the clamping device.

Application:

The adjustable switch delay permits a time-dependent switching sequence of hydraulic elements within a hydraulic circuit, independent of the hydraulic pressure. The valve can be operated from 40 bar to max. 250 bar.

A parallel or series circuit of several valves is possible. The compact size permits the valve to be flanged directly to the clamping fixture. If the valve should be connected to a pipeline, an adapter plate is available.

Features:

The hydraulic oil at the valve is guided in the body from the connection P through a throttle to a differential piston. At the same time, the hydraulic pressure is present at an integrated check valve, which blocks the flow to the connection A. Depending on the setting of the setting screw, the differential piston moves forward in a specific time and opens a check valve. This releases the flow from connection P to connection A, and the following hydraulic components are supplied with compressed oil.

If the hydraulic pressure is removed, a spring returns the differential piston to the initial position. The hydraulic oil flowing out is guided through a check valve to the connection P.

Note:

Observe installation instructions with construction notes for the fixture manufacturer. Operating pressure, volume flow, temperature and viscosity can result in changes to the switching sequence. The valve may be used up to a system pressure of maximum 250 bar. The switching intervals should be greater than 10 sec. to guarantee proper function.

Clamping procedure:

1. Cylinder 1 presses workpiece against stop a.
2. Valve opens A-line after the set time 1-10 sec.
3. Cylinder 2 and 3 run out with a time delay and press workpiece against stops b and c.

Application:

The 3/2 manual way seat valve allows to determine the direction of oil flow.

Features:

Hermetic sealing by ball seats. Sealing of the oil channels of the valve base with O-rings. The seat valve has completely hydraulic pressure compensation and negative switching.

Note:

The direction of flow has to be the direction of the arrow according to the symbol. The position of installation is optional. Hydraulic oil HLP or HLPD according to DIN 51524 Part 2.

65391	6910-06-05	-40 - +80	24	24	70/50	100	2000	IP 65

Design:

The ball, being the essential control element, is pressed either by a magnet or a spring onto the hardened ball seats. The blocked flow direction is thus hermetically shut off. The magnets work with or without a shift lever and are designed and checked to VDE 0580. The seat valve has a manual emergency actuator. A check valve is incorporated in channel P.

Application:

The 3/2-way seat valve is used to determine the direction of oil flow. These valves are mainly used for direct control of single-acting cylinders.

Features:

Hermetic sealing by ball seats. Sealing of the oil channels of the valve base with O-rings. The seat valve has completely hydraulic pressure compensation and negative switching.

Note:

The direction of flow must be the direction of the arrow according to the symbol. The position of installation is optional. Hydraulic oil HLP or HLPD according DIN 51524 part 2.

On request:

Directional seat valve with control voltage 230 V AC 50/60 Hz.

Diagram:

Dimensions apply on both sides.

327429	6982E-15-400	0-400	8,0-400	4,0-396	4,00	17-20	70

Design:

Compact electronic pressure switch with integrated 4-digit display. With two independent switching points and reverse switching points.
Stainless steel measuring cell with thin film DMS (expansion measuring strips).
Screw-in thread G $\frac{1}{4}$ A – DIN 3852-E, 2 switch outputs.

Application:

For the electronic-hydraulic pressure monitoring in pump units and in circuits of hydraulic clamping devices.

Features:

The four-digit digital display can depict the pressure in bar, psi or MPa.
Switching points and switch-back hystereses can be set independently. Switch-on and reset delay can be set from 0 to 99.9 seconds.
Adjustable display: current pressure, peak pressure value or to switching point 1 or switching point 2.
Simple handling via key programming.

Pin assignment:

Version with 2 switch outputs
pin plug 4-pol.M12x1

Design:

Compact electronic pressure switch with integrated 4-digit digital display for pressure measurement in the high-pressure range.

Stainless steel measuring cell with thin-film strain gauge. Screw-in thread G $\frac{1}{4}$ A – DIN 3852-E, 2 switch outputs.

Application:

For the electronic-hydraulic pressure monitoring in pump units and in circuits of hydraulic clamping devices.

Features:

Display rotatable in two axes. As a result, the device can be oriented optimally in almost every mounting position. The four-digit digital display can depict the pressure in bar, psi or MPa.

Switching points and switch-back hystereses can be set dependently. Switch-on and reset delay can be set from 0 to 99.9 seconds.

Adjustable display: current pressure, peak pressure value or to switching point 1 or switching point 2. Simple handling via key programming.

62968	6916-06	12	B - A	3	-20 - +90	1	95

Design:

Housing made of steel, surface galvanized. Sealing cone spring loaded with O-ring sealing. Sealings made of Perbunan.

Note:

The direction of flow is indicated on the hex nut housing by means of an arrow. On the threaded side sealing is done by means of a sealing edge and on the pipe side the valve is sealed by means of a cutting ring.

No. 6916-07

Shuttle Valve

max. operating pressure 630 bar.

Order no.	Article no.	Q [l/min]	Direction of flow	Differenz p at flow [bar]	Ambient temp. [°C]	Weight [g]
62984	6916-07	18	A-C / B-C	12	-20 - +100	160

Design:

Housing made of steel, surface galvanized. Ball seat valve type.

Application:

By means of two input connections which can be shut and an output connection the alternating valve connects A or B with C according to the present pressurized line; the other connection is closed by means of a ball.

Note:

Attention: The hydraulic line empties itself when not under pressure. The pipe connection is sealed by means of a cutting ring.

Subject to technical alterations.

326611	6916-12-04	20,9	11,2	18,72	21,0	19	47	5,7	G1/4	47

Design:

Housing made of steel, hardened and blued. Compact size.

Application:

For single and double-acting loads. The traversing speed can be set by controlling the flow.

Note:

The screw-in throttle check valve is screwed into the installation bore.
The upstream pressure relief valve in the hydraulic control guarantees to drain the surplus volume.
The throttle check valves should preferably be used for feed control.
Return flow control poses the risk of excess pressure.

Application examples for feed controls:

Design:

Cylinder body and internal parts made of stainless steel. Seals from NBR, Viton, POM and PU.

Application:

Couplings are used for the leakage-free connection of hydraulic oil supplies. The coupling elements are installed in a body. The sealing between coupling mechanism and nipple is axial, and installed in the coupling mechanism. If the seal is worn, it can be replaced. The coupling mechanism must always be used in combination with a nipple of the same system. Depending on the version, the couplings can be connected and disconnected at the maximum working pressure. When installed in a tank line, a coupling nipple with pressure relief must be selected. This limits the pressure that can be built up in the uncoupled state (for example due to internal leakage of the clamping elements) to approx 5 bar. When the two parts of the coupling are engaged, the pressure relief is no longer active.

Features:

For connection, the coupling mechanism and nipple must be axially aligned. The bodies of the two parts must be guided when the axial sealing surfaces are ca. 2-3 mm apart. The radial position tolerance must not be exceeded. The separating force due to hydraulic pressure is given by the formula NW3: $F [N] = 9,4 \times p [\text{bar}]$, NW5: $F [N] = 15,4 \times p [\text{bar}]$. This separating force must be countered by some external, mechanical means. The coupling mechanism must seal at the bottom of the hole in which it is installed. The mounting hole must be machined to the specified accuracy and surface finish.

Note:

The axial sealing surfaces on the front must be protected from soiling. Because the coupling elements have smooth, uninterrupted sealing surfaces, the danger of them being soiled is reduced, and the ease with which the user can clean them before the coupling process is increased. Good results can be achieved by washing them off and blowing clean with compressed air.

Positioning tolerance in axial direction for all coupling elements: +0.5 mm.

Positioning tolerance in radial direction for coupling units: +/- 0.3 mm.

Permitted angle tolerance: +/- 1°.

Diagrams: coupling force and flow resistance, see under 6989N.

Design:

Cylinder body and internal parts made of stainless steel. Seals from NBR, Viton, POM and PU.

Application:

Couplings are used for the leakage-free connection of hydraulic oil supplies. The coupling elements are installed in a body. The sealing between coupling mechanism and nipple is axial, and installed in the coupling mechanism. If the seal is worn, it can be replaced. The coupling mechanism must always be used in combination with a nipple of the same system. Depending on the version, the couplings can be connected and disconnected at the maximum working pressure. When installed in a tank line, a coupling nipple with pressure relief must be selected. This limits the pressure that can be built up in the uncoupled state (for example due to internal leakage of the clamping elements) to approx 5 bar. When the two parts of the coupling are engaged, the pressure relief is no longer active.

Features:

For connection, the coupling mechanism and nipple must be axially aligned. The bodies of the two parts must be guided when the axial sealing surfaces are ca. 2-3 mm apart. The radial position tolerance must not be exceeded. The separating force due to hydraulic pressure is given by the formula NW3: $F [N] = 9,4 \times p [\text{bar}]$, NW5: $F [N] = 15,4 \times p [\text{bar}]$, NW8: $F [N] = 31,4 \times p [\text{bar}]$. This separating force must be countered by some external, mechanical means. The coupling mechanism must seal at the bottom of the hole in which it is installed. The mounting hole must be machined to the specified accuracy and surface finish.

Note:

The axial sealing surfaces must be protected from dirt. Because the coupling elements have smooth, uninterrupted sealing surfaces, the danger of them collecting dirt is reduced, and the ease with which the user can clean them before the joint is made is increased. Good results can be achieved by washing them off and blowing clean with compressed air.

Positioning tolerance in axial direction for all coupling elements: +0.5 mm.

Positioning tolerance in radial direction for coupling elements: +/- 0.3 mm.

Permissible angle tolerance: +/- 1°.

Automatic coupling mechanism, threaded design

NEW!

Order no.	Article no.	for coupling under pressure	for pressure-free coupling	Thread [A]	Nominal bore [NW]	max. operating pressure [bar]	max. coupling force [N]	Q max. [l/min]	Weight [g]
567056	6989MA-05-01	●	-	M36 x 1,5	5	350	5,39	12	206
567057	6989MA-05-02	-	●	M36 x 1,5	5	350	5,39	12	206

Design:

Body and internal parts made of stainless steel. Seals made of NBR, Viton and FKM.

Application:

Couplings are used for the leakage-free connection of hydraulic oil supplies. The coupling elements are installed in a body. The sealing between coupling mechanism and nipple is axial, and installed in the coupling mechanism. If the seal is worn, it can be replaced. The coupling mechanism must always be used in combination with a nipple of the same system. Depending on the version, the couplings can be connected at the maximum operating pressure. The patented automatic coupling mechanism on the system connects coupling components and/or components without additional stroke. For example, the hydraulically actuated system dispenses with the lifting device otherwise needed on rotary tables of machine tools Shuttle tables or pallets can be coupled to the rotary table solely by radial movement.

Features:

Wherever no coupling stroke is possible, this coupling can be connected at a separate control pressure. The gap between coupling nipple and coupling mechanism can be between 0.6 and 1.0 mm. The faces of the coupling surfaces on coupling nipple and coupling mechanism are flat. The user can therefore position them for connection from any axial and/or radial position subject to compliance with the positioning tolerance. The coupling stroke is then performed by an integrated control piston A. It is possible to control individual couplings in a targeted manner. Control pressure A should be applied at the same pressure as medium pressure P. With control connection A depressurised, the coupling mechanism is always in its default position. The coupling force between coupling nipple and mechanism due to hydraulic pressure is given by the formula $F [N] = 15.4 \times p [\text{bar}]$ and must be applied in a force-locking or form-locking manner from the outside. The coupling mechanism should be operated in a dual-action manner.

Advantage:

- no additional coupling stroke required
- can be connected without pressure
- targeted activation of individual couplings is possible
- coupling elements made of stainless materials.

Note:

The axial sealing surfaces on the front must be protected from soiling. Because the coupling elements have smooth, uninterrupted sealing surfaces, the danger of them being soiled is reduced, and the ease with which the user can clean them before the coupling process is increased. Good results can be achieved by washing them off and blowing clean with compressed air.
 Spacing of nipple/mechanism: 0.8 mm +/- 0.2 mm
 Positioning tolerance in radial direction with coupling elements: +/- 0.2 mm
 Operating temperature: -10°C to +80°C
 Assembly tool for sealing ring: Order no. 551864
 Screw-in tool: Order no. 567094

Installation dimensions:

Coupling force:

Flow resistance:

Separating force:

$$NW 5 = F [N] = 15,4 \times p [\text{bar}]$$

Operating principle:

1. Control port B: Coupling mechanism in basic setting
 2. Positioning of the coupling nipple for coupling mechanism, complying positioning tolerance
 3. Control port A: A connection is established to the coupling nipple side.
 4. Media pressure to connection P
- A = Control pressure (extend)
 B = Control pressure (retract)
 P = Media pressure

Installation principle:

Subject to technical alterations.

323477	6991-60	6	6	-10 - +60	14,0	40	5	5,8

Design:

Rotary feed-through housing from spheroid graphite iron with radial oil connections 1/4" thd. Rotary piston from nitrided, hardened steel with radial and face side oil connections 1/4" thd. The reductions in the face side connections can be use as O-ring connection.

Application:

Rotary couplings transmit flows of hydraulic oil from a stationary machine component to a rotating one. They are located in the rotary axis of a rotating system. The rotary couplings are generally designed for hydraulic systems. To transmit air flows, they have to be filtered, oiled, and free of water. Single-acting and double-acting cylinders can be connected. Each cylinder channel requires a separate connection on the housing and on the rotor.

Features:

Because of the high-grade seal packages it is possible to operate at high pressures. Multistrand rotary oil couplings. Long service life. Compact design.

Note:

Max. pressure and max. rpm must not occur together. See diagrams.

The rotary couplings must be operated without bending forces. We recommend that you screw the rotating housing with the connections to the clamping fixtures and secure the rotary piston only against twisting. Do not introduce any bearing loads! The line connections to the rotary piston must always be made with hoses. The frictional resistance on the seals is pressure-dependent. This must be taken into account when calculating the drive torque for the rotary table. The rotary couplings are fundamentally designed for intermittent operation.

Special versions available on request. See diagrams for minimum and maximum load data.

324558	6992H-11-10	1	1	1	9	-10 - +60	8	5	3,5

Design:

Rotary feed-through housing from spheroid graphite iron with radial oil connections 1/4" thd. Rotary piston from nitrided, hardened steel with radial and front oil connections 1/4" thd. The reductions in the face side connections can be used as O-ring connections.

Application:

Rotary couplings transmit flows of hydraulic oil from a stationary machine component to a rotating one. They are located in the rotary axis of a rotating system. The controlled rotary couplings may only be operated with hydraulic oil. Types 6992H-11 are designed for single-acting cylinders. One loading/unloading station and 5, 7 or 9 processing stations can be connected.

Features:

Rotary vane construction. Multiple hydraulic cylinders are supplied with hydraulic oil simultaneously. At the same time, a loading and/or unloading station can be controlled via directional valves for clamping and/or unclamping. High operating pressures due to high-quality components and seals. Compact design. Long service life.

Note:

The controlled rotary couplings can only be used for cyclic operation or at very low rpms. The rotary couplings must be operated without bending forces. We recommend that you screw the rotating housing with the connections to the clamping fixtures, and to secure the rotary pistons only against twisting. Do not introduce any bearing loads! The connections to the rotary pistons must always be via hoses. At operating pressures above 200 bar oil losses occur when the loading and unloading station are unloaded; this can be compensated for using an accumulator. The accumulator that is selected must have the appropriate safety equipment and comply with the safety regulation of the country concerned. We recommend the use of directional seat valves for controlling the rotary couplings.

6992H-11-06

6992H-11-08

6992H-11-10

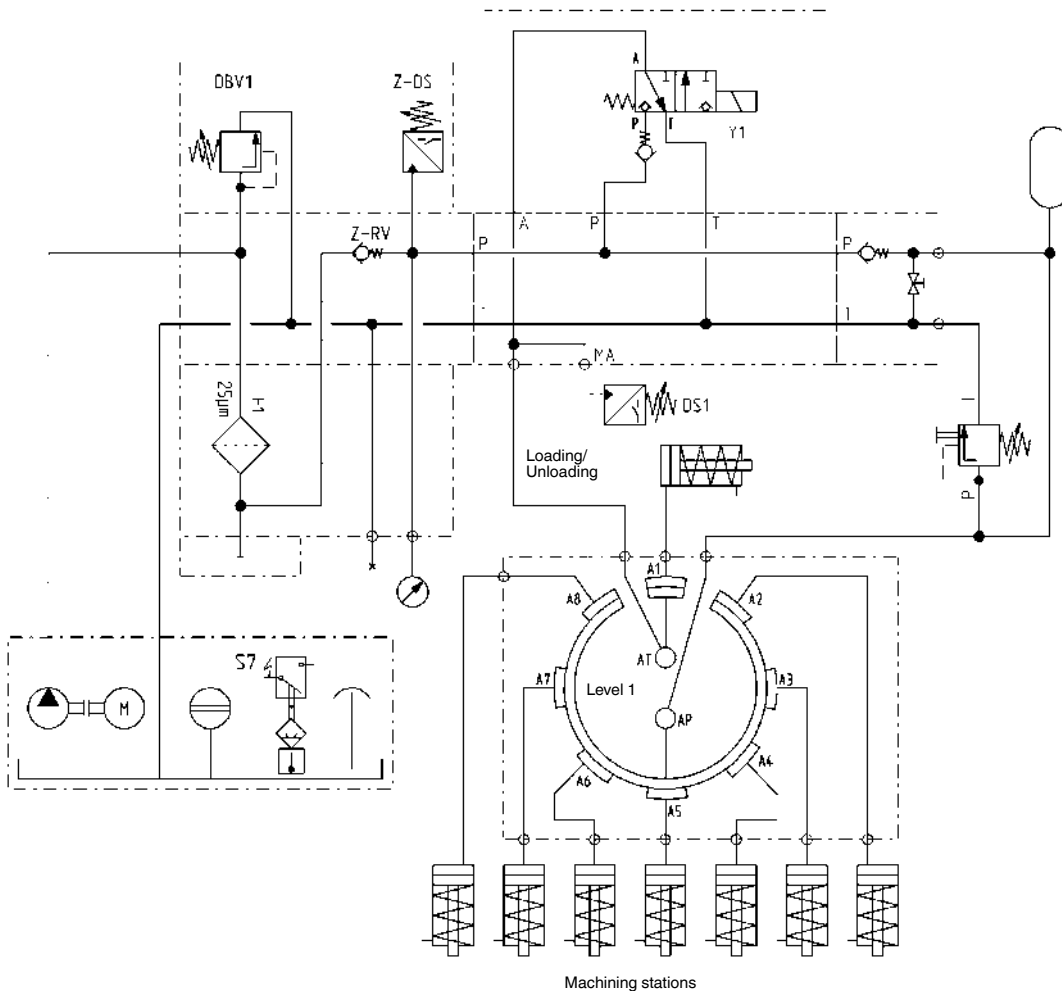

Subject to technical alterations.

Application example:

Example of schematic:

Rotary union single acting, controlled, 1 x loading, 7 x machining
 The loading and unloading station is controlled by a 3/2 way valve. The machining stations are directly controlled by the pump. The separation of loading and unloading station and machining stations by the rotary union is not leakagefree. Leakage increases with pressure. A pressure accumulator can be used for leakage compensation. The next cycle must only be performed when the loading or unloading station is clamped.

No. 6992H-21

Rotary coupling

controlled, double-acting.
One loading and unloading station,
max. operating pressure 350 bar

Order no.	Article no.	Connections inputs loading	Connections inputs processing	Connections outputs loading	Connections outputs processing	Ambient temp. [°C]	Q max. [l/min]	NG	Weight [Kg]
324566	6992H-21-06	2	2	2	10	-10 - +60	8	5	4,1
324574	6992H-21-08	2	2	2	14	-10 - +60	8	5	4,0
324582	6992H-21-10	2	2	2	18	-10 - +60	8	5	3,9

Design:

Rotary feed-through housing from spheroid graphite iron with radial oil connections 1/4" thd. Rotary piston from nitrided, hardened steel with radial and front oil connections 1/4" thd. The reductions in the face side connections can be used as O-ring connections.

Application:

Rotary couplings transmit flows of hydraulic oil from a stationary machine component to a rotating one. They are located in the rotary axis of a rotating system. The controlled rotary couplings may only be operated with hydraulic oil. Types 6992H-21 are designed for double-acting cylinders. One double-acting loading/unloading station and 5, 7 or 9 double-acting processing stations can be connected.

Features:

Rotary vane construction. Multiple hydraulic cylinders are supplied with hydraulic oil simultaneously. At the same time, a loading and/or unloading station can be controlled via directional valves for clamping and/or unclamping. High operating pressures due to high-quality components and seals. Compact design. Long service life.

Note:

The controlled rotary couplings can only be used for cyclic operation or at very low rpms. The rotary couplings must be operated without bending forces. In contrast to the uncontrolled versions, we recommend that you screw the rotating housing with the connections to the clamping fixtures, and to secure the rotary pistons only against twisting. Do not introduce any bearing loads! The connections to the rotary pistons must always be via hoses. At operating pressures above 200 bar oil losses occur when the loading and unloading station are unloaded; this can be compensated for using an accumulator. The accumulator that is selected must have the appropriate safety equipment and comply with the safety regulation of the country concerned. We recommend the use of directional seat valves for controlling the rotary couplings.

No. 6919-2

Pallet Decoupler Block

for single acting cylinders,
max. operating pressure 400 bar.

Wiring diagram symbols:

- = Pressure gauges, Order no. 161414
- SP = Accumulator, Order no. 67645
- DBV = Pressure relief valve, Order no. 181222
- V = 3/2 Manual directional valve, Order no. 114298
- K1-K4 = Pressure outputs (Threaded plug), Order no. 69419
- P1 = Pressure input (Coupling plug), Order no. 69039
- P2 = Pressure input (Threaded plug), Order no. 69419
- T = Release opening DBV

Wiring diagram:

Order no.	Article no.	Set gas preload p0 [bar]	Reservoir volume [cm³]	NG	Q max. [l/min]	Connections inputs P1+P2	Connections outputs K1 to K4	Weight [g]
61168	6919-2	80*	13	4	7,5	G1/4	G1/4	4400

* Adjustable between 20 and 250 bar at works (on request).

Design:

- Distributor made of phosphatized steel
- 3/2-way manual seat valve
- Accumulator
- Pressure-relief valve set to 400 bar
- Pressure gauge (600 bar; nom. size 63; with glycerin damping)
- Coupling connector No. 6990 G1/4 S and fittings

Application:

The main application for the pallet decoupler block is to maintain pressure at fixtures which are disconnected from the pump unit during the machining process. For example on flexible machining centers with pallet changing systems. With tight hydraulic elements a loss in pressure shall be limited to 2 bar/h (see diagram). The integrated accumulator can compensate for a leakage-oil quantity of approx. 6 cm³ in the range from 150 to 400 bar. The pressure input is connected to P1 or P2 and observed by the pressure gauge.

1. Couple pump unit with pallet decoupler block.
2. Switch manual seat valve to flow.
3. Remove workpiece or insert a new.
4. Operate pump unit (clamp).
5. Once pressure has been built up (check at pressure gauge), the seat valve must be set to close.
6. Operate pump unit (unclamp).
7. The pump unit is uncoupled from the pallet decoupler block.

Features:

After disconnecting the pump unit the clamping fixture cannot be depressurized even by operating the seat valve. Compact design. Load outputs (K1 to K4).

Note:

1. If the seat valve is opened in the uncoupled condition, it cannot be coupled again. The seat valve must then be switched to close. Loosen the coupling connector SW (AF) to depressurize 22 and then tighten again.
2. The clamping point can also have pressure applied when the seat valve is set to close.

Diagram:

Subject to technical alterations.

No. 6919-20

Pallet Decoupler Block

for double acting cylinders,
max. operating pressure 400 bar.

Wiring diagram:

The pressure for unclamping must be at least 20% of the clamping pressure.

A3 * Pressure accumulator necessary for functioning.

Order no.	Article no.	Q [l/min]	Outputs clamp A2 to A5	Outputs unclamp B2 to B5	Weight [g]
320002	6919-20	7,5	G1/4	G1/4	2572

Design:

Manifold made of steel, blued. Integrated, fixed set pressure relief valve. 4 connections for consumers, pressure tank and manometer. Including coupling connector No. 6919-20S, order no. 320010 and G1/4 adapter for connection A2. A filter is integrated in the forward and return line.

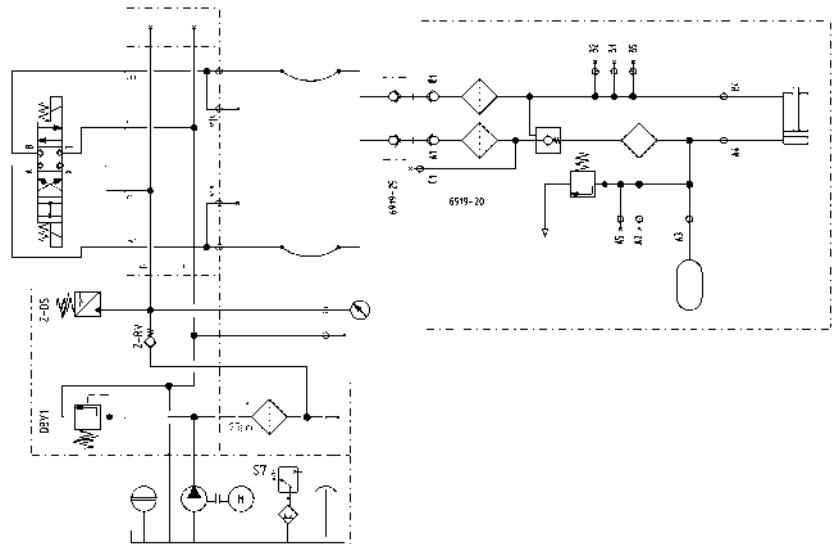

Application:

The main application for the pallet decoupler block is to maintain hydraulic pressure at fixtures which are disconnected from the pressure generator during the machining process. For example on flexible machining centers with pallet changing system. Possible small oil leakage are compensated in a particular pressure range by the attached accumulator. Please see technical details of the used accumulator (No. 6919-13 or No. 6919-40). During coupling clamping circuit and return drive circuit must be without pressure.

Note:

The use of an accumulator no. 6919S-013/040 in the clamping circuit is necessary. For visual pressure observation, a pressure gauge no. 6983-1 shall be attached.

Hydraulic diagram:

Subject to technical alterations.

No. 6919-25

Coupling Unit for Pallet Decoupler Block

max. operating pressure 400 bar.

Order no.	Article no.	Q [l/min]	Weight [g]
320028	6919-25	7,5	2200

Design:

The coupling unit consists out of two coupling mechanism No. 6919-25M, order no. 320036 for clamping and unclamping circuit. The coupling elements are mounted to an adapter with handle and disengaging mechanism.

Application:

The coupling unit is used to connect the oil supply with the pallet decoupler block No. 6919-20.

Features:

Simple handling due two hand operation. Interchanging of connections is impossible.

No. 6919-30

Store Station for Coupling Unit

Order no.	Article no.	Weight [g]
320044	6919-30	1837

Design:

Safety sensor switch integrated and coupling connector No. 6919-20S, order no. 320010.

Application:

The store station is used as holder for the coupling unit after decoupling from the pressure tank switch unit.

Features:

If used with your machine control, the signal of the safety sensor switch, can ensure that the fixture pallet cannot be moved before the coupling unit is disconnected and removed correctly from the pallet decoupler block.

Subject to technical alterations.

No. 6919S

Accumulator

6919S-013

6919S-040

Order no.	Article no.	Reservoir volume [cm ³]	Gas preload p ₀ max. [bar]	Set gas preload p ₀ [bar]	max. perm. over-pressure [bar]	Ambient temp. [°C]	Weight [g]

67637	6919S-040	40	250	80	400	-20 - +60	650

Design:

- Hydro diaphragm reservoir
- Filling gas = nitrogen, class 4.0
- Pressure fluid: hydraulic oil acc. to DIN 51524 Part 1 and 2; viscosity ISO VG 10 to ISO VG 68 acc. DIN ISO 3448.
- Thread G1/4 A, DIN ISO 228/1 with sealing edge.

Application:

- For short-term compensation of oil losses in stand-by operation;
- to support during switching procedures in hydraulic circuits;
- to compensate for pressure peaks when switching valves;
- for compensation of volume changes of closed circuits in case of temperature changes.

Note:

The reservoirs are manufactured, checked and marked according to the technical rules for pressure containers (TRB). Max. permissible operating pressure ratios p₂ max : p₁ max isothermal = 4:1
Max. permissible operating pressure ratios p₂ max : p₁ max adiabatic = 3:1.

320069	6981-40-G1/4	40	380

Design:

Housing out of steel, zinc plated. Filter insert out of stainless steel, with o-ring. Pre-filtration by filter disc. Filter insert out of wire web.

Application:

The Filters are used as an additional safety in order to protect the hydraulic components in the oil circuit. The filter can be located direct in pipes, in front of distributors or in fittings. For example:

- 10 μm input Intensifier
- 25 μm input valves
- 40 μm input pump units or hydraulic cylinder

Note:

The smaller the filter that is chosen, the bigger the flow resistance will be. The degree of filter soiling must be checked. Due to the design of the housing the exchange of the filter insert is simple. The direction of oil flow has to be considered. Can only be installed in P or T line. The installation position is optional. The volume flow for filter inserts is illustrated by the diagram for filter 6981.

Spare part:

- Filter insert 10 microns, order no. 320077
- Filter insert 25 microns, order no. 320085
- Filter insert 40 microns, order no. 320093

No. 6981G
Filter with rectifier circuit

max. operating pressure 400 bar.

Order no.	Article no.	Filteration	Weight
		[μm]	[g]
321901	6981G-10-G1/4	10	1510
321927	6981G-25-G1/4	25	1510
321968	6981G-40-G1/4	40	1510

Design:

Body from zinc-plated steel. Filter insert from aluminium. Filter material from pleated metal fibre.

Application:

The filters are employed as additional and safety filters for protecting hydraulic components in the oil circuit. They can be used as a pipeline or mounted element with O-ring connection. The flow through these filters is always from outside to inside, regardless of whether they are in the flow or return circuit. This prevents the whirl-up of dirt particles on the filter element.

Note:

The finer the filter, the greater the flow resistance.

The degree of soiling must be checked and the filter elements replaced at regular intervals. The large threaded plug on the side must be removed to replace the filter element. The filter element can then be removed.

The entire installation position can be chosen freely!

Replacement part:

 Filter insert 10 μm , Order No. 323683

 Filter insert 25 μm , Order No. 323709

325217	6984-30	5	1 - 2	1,9	2,6	36

Design:

Housing from hardened and burnished steel. Pistons are tempered, nitrided and ground. Compression spring from stainless steel.

Application:

The support control is used in fixtures where a signal indicating a correctly supported workpiece is required to enable machining. Lightweight workpieces should be clamped before being pressurised with compressed air.

Features:

The support control works like a pneumatic back-pressure nozzle. The position is extended from its initial position by a pressure spring. Once applied, the air jet flows through the hollow piston and the radial discharge hole on the support control housing to outside. The discharge hole is sealed as soon as a workpiece is mounted and the piston is pushed downwards by min. 1 mm. The air flow backs up, the internal air pressure rises. The pressure value must be transferred to the control by an appropriate pressure signal converter. The system is relatively insensitive to fine chips.

Note:

The pressure signal converter is not included in the supply scope.

Effective piston surface with closed nozzle = 0.95 cm²

Piston force = piston surface x air pressure + spring force

Reduce the input pressure to 1 bar up to a maximum of 2 bar when the air duct is open, e.g. with a throttle check valve. When the air duct is closed, there is a dynamic pressure of approx. 3 bar.

Installation dimensions:

Design:

Steel fittings, galvanized and passivated. Hose of synthetic material with steel-wire braid galvanized.

Application:

Insert hose and tighten with 1/4 turn maximum.

Note:

We recommend only using the 3-metre long high pressure hose for double-acting elements. Fitting suitable for pipe connection No. 6994. The maximum service life must be 6 years but the maximum service life must not exceed 10 years. Date of manufacture (quarter/year) is printed on the hose. Serviceability must be assessed in accordance with established inspection criteria. See DIN 20066, section 5 for further details.

Design:

Steel fitting, galvanized and passivated. Hose of synthetic material with high tensile brass steel-wire braid.

Application:

Insert hose and tighten with 1/4 turn maximum.

Note:

We recommend only using the 3-metre long high pressure hose for double-acting elements. These high pressure hoses can be used directly in pipe connections. The maximum service life must be 6 years but the maximum service life must not exceed 10 years. Date of manufacture (quarter/year) is printed on the hose. Serviceability must be assessed in accordance with established inspection criteria. See DIN 20066, section 5 for further details.

Design:

Galvanized housing. The socket and plug are locked automatically in uncoupled state. Plastic dust caps are supplied as standard for the socket and the plug.

Features:

The hydraulic quick-release couplings for the high pressure area are easy to use, safe and reliable. It is a drip-free coupling that protects both the environment and the hydraulic system. The safety latch is standard and offers additional safety. It prevents accidental decoupling.

No. 6990MK/SK

Design:

Steel housing burnished for screwing in, splash-proof by means of chip-resistant glass pane, with water drain notches.

Application:

For quick, direct reading of hydraulic pressures in fixtures. Pressure gauge is protected by a chip-resistant glass pane. The structural shape prevents any accumulation of chips.

Note:

For screwing into the fixture with O-ring connection. Anti-rotation device by means of two pins. To align the display at an angle of 45°.

562214	6983B-10-400	400	321646	M8 x 75 (8.8)	1887

Design:

Steel housing, burnished, splash-proof by means of chip-resistant glass pane. Supplied as standard with O-ring, oil plugs and fastening bolts. Oil supply via threaded connection or oil channel in the fixture body.

Application:

For quick, direct reading of hydraulic pressures in fixtures. Pressure gauge is protected by a chip-resistant glass pane.

Note:

The bottom oil channel is plugged by a sealing washer and an M4 x 6 bolt. The display can be aligned freely with waf 13.

Subject to technical alterations.

Design:

Housing, socket bolt and seal element (metal sealing action) made of stainless steel, soft seal made of FKM.

Application:

Vent screw for venting clamping devices and clamping elements. Compact and simple design or handling. Insensitive to external influences. Suitable for temperatures up to 150 °C. It is sufficient to open the vent screw by half a turn.

Note:

Only an Allen key **SW3** is required for bleeding. The inner vent screw is opened anticlockwise. Therefore, there is no risk of loosening the outer screw when closing. Observe torque specifications.

562209	6980FRK-16	-	●	7-20	24	252

Design:

Housing and lever made of steel, burnished. Roller made of hardened steel or plastic

Application:

Workpieces are held in position before the clamping operation and prevented from falling out.

Features:

Countless variants are possible by combining the various mounting variants and deflection directions. Damage to the workpiece surface is prevented by using the roller.

Note:

The deflection can be changed by altering the position of the stop screw with the thrust piece in the housing. The position is secured with the clamping screw. In the normal position, the lever is changeable by 90°.

Replacement part:

Roller made of steel 6958FRS-16-06: order no. 562538

Roller made of plastic 6980FRK-16-06: order no. 562539

convertible: right lever

convertible: lever by 90° respectively

Installation dimensions:

562207	6980MK-10	10	52	9	15	64	69

Design:

Housing made of steel, burnished. Plunger hardened.

Application:

Workpieces are held in position before the clamping operation and prevented from falling out.

Features:

Thanks to the cylindrical shape, the screw-in failover can be used 360°. Fine adjustment by screwing in or unscrewing the failover.

Note:

Plungers can be individually designed in length and ball diameter and are available on request. For installation, use hook spanner order no 54916.

Installation dimensions:

THE FIRST STEP FOR USE AND EMPLOYMENT OF SIDE THRUST PIECES:

- > What is being positioned or clamped?
- > Which side thrust pieces will be used?
- > What size corresponds to the workpiece?
- > What tolerance does the workpiece have?
- > How large is the dimension Y? (Workpiece height)
- > How large is the dimension X? (See table)
- > Should the spring deflection be completely used?
- > How is the coordinate dimension determined?

EXAMPLE: POSITIONING OR CLAMPING A PLATE 100 X 50 X 8 MM

Should the pin diameter be 5, 6 or 8 mm?

- > If nothing may extend over the plate 5 mm
- > If projection would not be a problem 6 or 8 mm
- > If clamping will be done additionally 6 mm
- > If drilling will be performed without additional clamping 8 mm

Workpiece height Y?

The tolerance can be ignored

What force should be selected?

- > For positioning tasks 30 - 60 N
- > For clamping forces 90 - 150 N

Length / width of the workpiece?

- > Length = $100 +0/-0.4$ = medium dimension 99,8 mm
- > Width = $50 +0,2/-0.2$ = medium dimension 50,0 mm

Dimension X for side thrust pieces with steel spring?

- > See table or formula below

W = workpiece (+/- tolerance)
 - F = pre-tension
 F = (-F) + (+F)

Y = workpiece height
 + F = clamping force (spring deflection for tolerance)
 T = tolerance

For workpieces that are higher than C minus r, the table values for dimension X or the formula $X = B/2 - (-F)$ apply.

For workpieces that are smaller than C minus r, the table values for dimension X or the formula $X = B/2 - (-F) - [(C - r - Y) \times 0,123]$ apply.

Formula for coordinates:

$$K = W - T/2 + x + S/2$$

The table values are standard values that should ideally be checked using a sample clamping.

No. 6380D

Side thrust piece, with seal

against chips and dirt.

Steel pin for clamping: hardened and galvanised

Sleeve: Aluminium

NO. 6945-02-04

> Clamping stud

THE FOLLOWING SYSTEM ELEMENTS ARE USED TO MEET THE REQUIREMENTS

- > Fixed clamping bars for press table and piston for the clamping of tools with common clamping edge heights and tool-pallet sizes (fig. 4, right-hand side).
- > Clamping heads, sliding in T-groove, for holding tools for the press table and the piston (fig. 5, right-hand side).
- > Hydraulic clamping devices at stud for the clamping of tools equipped with a clamping pin (fig. 6, right-hand side, and 1).
- > Tool pallets (upon request) for tools
- > Fixed pallets for each tool
- > Interchangeable pallets, i.e. one pallet for several tools.
- > Pump unit with 4 or 5 separate clamping circuits.

SAFETY WHEN USING CLAMPING HYDRAULICS

The pump device is equipped with 4 or 5 separate clamping circuits and additional pressure switches in all circuits. In addition, the oil level is monitored by a float switch (fig. 2). Pressure switch and float switch are connected in series in a terminal housing and are routed to the terminal rail of the device controller. Control and safety functions can be integrated into the machine controller via the 13-pin socket of the device controller. In case of a pressure-drop in one or more clamping circuits, or if the oil level is low, the press is shut down automatically.

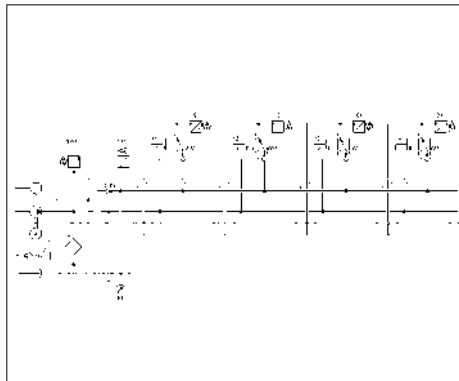

The hydraulic clamping elements are supplied diagonally at the table and at the piston by two independent and pressure-controlled clamping circuits (fig. 3).

FIGURE 1

- > Clamping strip on table and stud clamping on plunger

FIGURE 2

- > Hydraulic diagram pressure generators

FIGURE 3

- > Safety circuit

AMF has developed a „Hydraulic tool-clamping system for presses“ which reduces the set-up times of the press to the absolute minimum. The system is designed for „old“ as well as „new“ presses of various manufacturers. This system also takes into account the storage, transport and frequency of use of the tools.

The developments observed in non-cutting operations shows an increasing demand for smaller machining lots, which of course requires a sound economic, cost-effective, basis. Primary machining times and secondary set-up times must be minimized. In several instances, presses have reached their stroke-cycle limits for tools or workpieces. Accordingly, development is now focussed on the minimization of set-up times.

When converting a press to another product, down-times are inevitable for the following reasons:

- > removal of tool
- > installation of new tool
- > adjustment of press to new tool

The set-up of the press is has been reduced to a minimum by CNC control. What remains for optimization is the tool-changing time. This is where you may benefit from our products.

OUR „HYDRAULIC TOOL-CLAMPING SYSTEM FOR PRESSES“ MEETS THE FOLLOWING REQUIREMENTS:

- > Safety is ensured, i.e. tool storage, transport and tool clamping comply with strict requirements.
- > Various press types can be equipped.
- > Solutions are available for already present as well as new press types.
- > Set-up times are significantly reduced.
- > Tool storage is controlled.
- > The removal of tools from the rack, transport and insertion into the press are more efficient, safer and easier for the user.
- > The system can be quickly installed at any press
- > ... and is suitable for frequently used tools as well as for rarely used tools.

No. 6906P

Pump Unit

with 4 separate clamping circuits, single acting, max. operating pressure 400 bar.

Order no.	Article no.	Clamping circuits	Q [l/min]	Valve type	Matching control unit	Weight [Kg]
326702	6906P-64319	4	2,5	4 x 3/2 + DS	6906PB-4-4, 6906PB-4-5	65

Design:

Compact, plug-in pump unit, ready for electric and hydraulic operation. Complete with: pressure limiting valve and pressure switch, solenoid valve, pressure gauge, float switch, oil fill, electrical control with main switch, indicator lamps and flange sockets. Electrical connection complete with CEKON connector plug.

Application:

The pump unit is designed to operate hydraulic clamping systems.

Features:

The radial piston pump is driven via an alternating current standard motor with the energy efficiency class IE3. The motor is protected against overload by a motor protection switch and a thermoelement. Each of the 4 clamping circuits is equipped with a 3/2 seat valve. Four pressure switches (DS) are attached externally for the external pressure monitoring. Pressure setting and pressure monitoring are accomplished via a pressure limiting valve (DBV) and an electronic pressure switch (EDS). The value set at the pressure limiting valve is stored with the Mode button on the pressure switch. This simultaneously sets the preprogrammed switch-off and switch-back point.

The pump unit operates intermittently. In the case of a pressure drop, the pump unit is activated automatically by the pressure switch. The clamping pressure is indicated using illuminated push buttons. The installed float switch switches off the pump in the case of low oil level and outputs an optical signal.

Note:

Pay attention to faultless venting during the connection of the elements. Pumping in the case of pressure drop must be made maximum 2x per minute. The unit must not operate continuously. To ensure safe hydraulic tool clamping, clamping at ram and table is carried out in each case by means of a separate clamping circuit. The four pressure switches DS1-DS4 are used to provide external pressure monitoring of the four clamping circuits. The machine is automatically switched off if pressure drops in one clamping circuit or in the case of lack of oil. The electrical connection between press controller and power unit must be performed by the customer.

Pump Unit No. 6906P

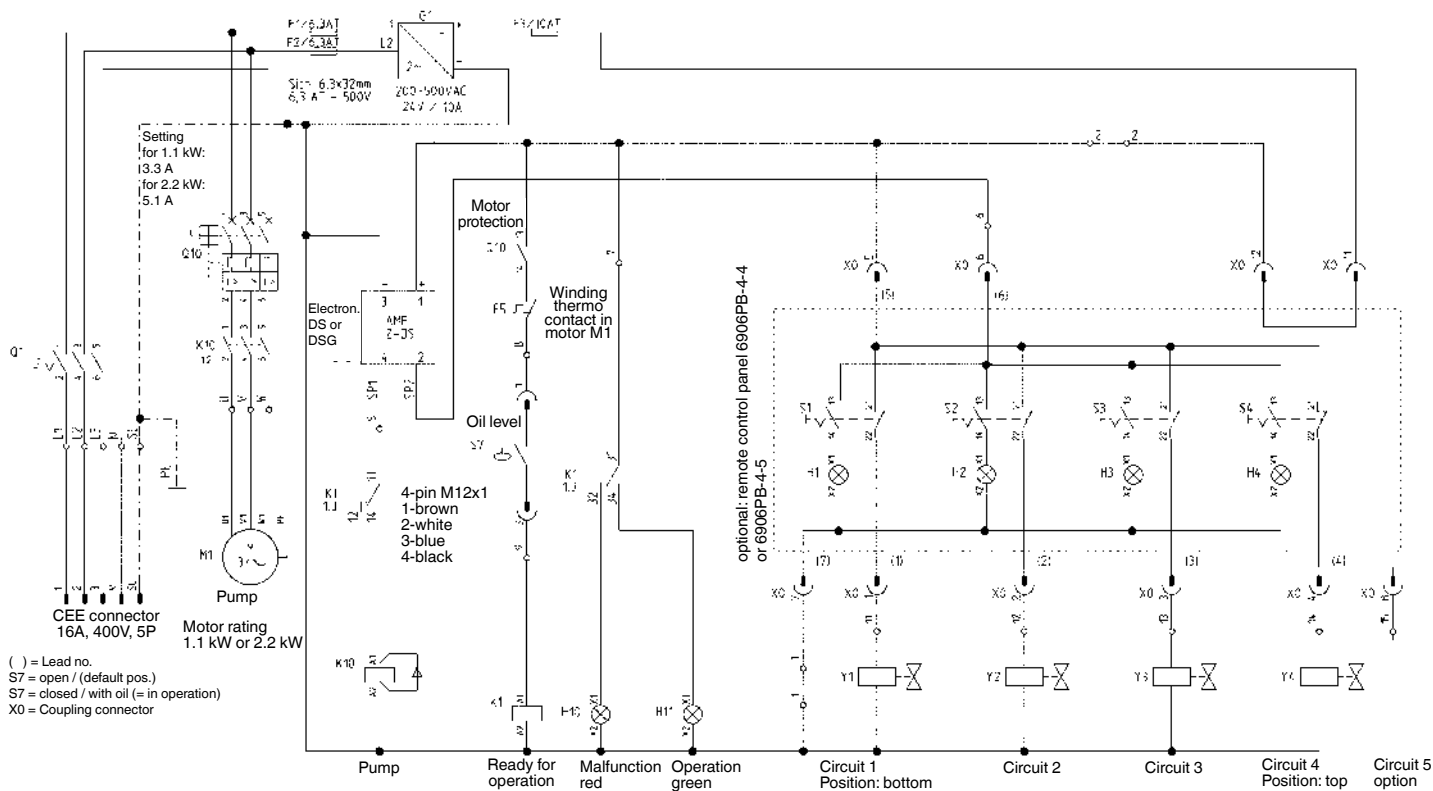

Hydraulic specifications:

Max. operating pressure	400 bar
Oil capacity, reservoir	ca. 10 litres
Oil capacity, usable	ca. 4 litres
Oil-flow rate	2,5 l/min.
Valve types	4x 3/2 seat valve and 4x pressure switch for external pressure monitoring
Hydraulic connection	thread G1/4
Noise level	max. 70 dB(A)
Ambient temp. range	-10° C to + 35° C
Position of use	upright
Pump design	radial-piston pump with 3 pistons
Load cycle	max. 500/h
Fluid	hydraulic oils HLP and HLPD according to DIN 51524 part 2
Oil recommendation	HLP 22 and HLPD 22 or HLP 32 and HLPD 32
Viscosity	ISO VG 22 and 32 DIN ISO 3448

Electrical specifications:

Nominal voltage	400 V/50 Hz three-phase
Control voltage	24 V DC
Valve voltage	24 V DC
Motor speed	2900 1/min.
Direction of rotation	any
Motor rating	1,1 kW
Motor type	three-phase standard motor
Nominal current	3 A
Fuse, supply line	16 A slow-blow
Fuse, control circuit	1 A primary, 4 A secondary
Electrical connection	Öflex 100; 5x1,5 mm ² 3 m with CEE connector 16 A 6 h
Protection class	IP 54
Duty cycle	max. 50 % intermittent operation
Operation type	Socket for remote control
Fill-level monitoring	Float switch

Wiring circuit of pump unit with 4 clamping circuits, remote control

To increase safe handling of the clamped parts, the unit ready for operation and a clamping pressure query should be integrated with the processing machine.

Note: 1 to 4 circuits = directional seat valve clamped with power off

No. 6906P

Pump Unit

with 5 separate clamping circuits, single acting,
max. operating pressure 400 bar

Order no.	Article no.	Clamping circuits	Q [l/min]	Valve type	Matching control unit	Weight [Kg]
326728	6906P-65319	5	2,5	4 x 3/2 +DS 1 x 3/2 +SV +DS	6906PB-6-4	71

Design:

Compact, plug-in pump unit, ready for electric and hydraulic operation. Complete with: pressure limiting valve and pressure switch, solenoid valve, pressure gauge, float switch, oil fill, electrical control with main switch, indicator lamps and flange sockets. Electrical connection complete with CEKON connector plug.

Application:

The pump unit is designed to operate hydraulic clamping systems. Clamping circuits 1 to 4 are for tool clamping, circuit 5 is for raising the hydraulic ball-roller strip.

Features:

The radial piston pump is driven via an alternating current standard motor with the energy efficiency class IE3. The motor is protected against overload by a motor protection switch and a thermoelement. Each of the 4 clamping circuits is equipped with a 3/2 seat valve. Four pressure switches (DS) are attached externally for the external pressure monitoring. In the 5th circuit, there are a 3/2-way valve, normally open, a pressure-limiting valve, and a pressure switch. Pressure setting and pressure monitoring are accomplished via a pressure limiting valve (DBV) and an electronic pressure switch (EDS). The value set at the pressure limiting valve is stored with the Mode button on the pressure switch. This simultaneously sets the preprogrammed switch-off and switch-back point.

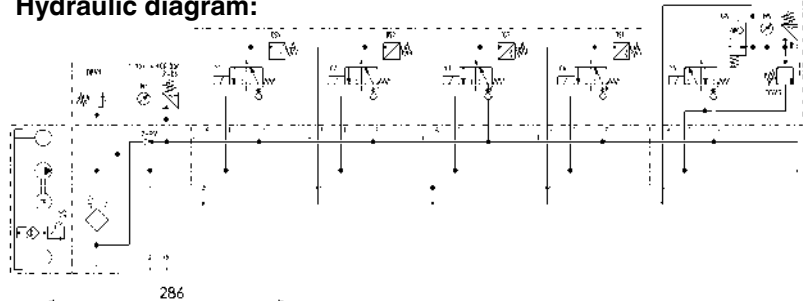

The pump unit operates intermittently. In the case of a pressure drop, the pump unit is activated automatically by the pressure switch. The clamping pressure is indicated using illuminated push buttons. The installed float switch switches off the pump in the case of low oil level and outputs an optical signal.

Note:

Pay attention to faultless venting during the connection of the elements. Pumping in the case of pressure drop must be made maximum 2x per minute. The unit must not operate continuously. To ensure safe hydraulic tool clamping, clamping at ram and table is carried out in each case by means of a separate clamping circuit. The four pressure switches DS1-DS4 are used to provide external pressure monitoring of the four clamping circuits. The machine is automatically switched off if pressure drops in one clamping circuit or in the case of lack of oil. The electrical connection between press controller and power unit must be performed by the customer.

Duty cycle	max. 50 % intermittent operation
Operation type	Socket for remote control
Fill-level monitoring	Float switch

Wiring circuit of pump unit with 5 clamping circuits, remote control

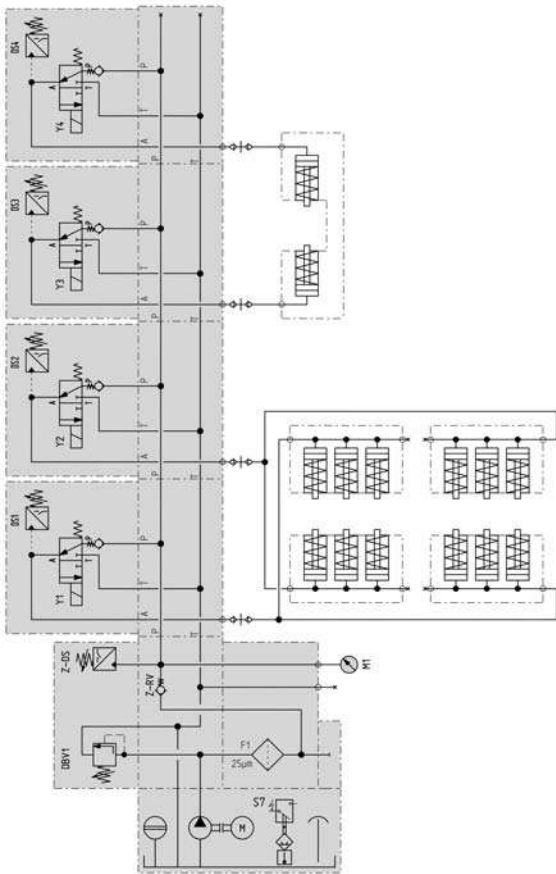

To increase safe handling of the clamped parts, the unit ready for operation and a clamping pressure query should be integrated with the processing machine.

Note: 1 to 4 circuits = directional seat valve clamped with power off
5 circuit = directional seat valve unclamped with power off

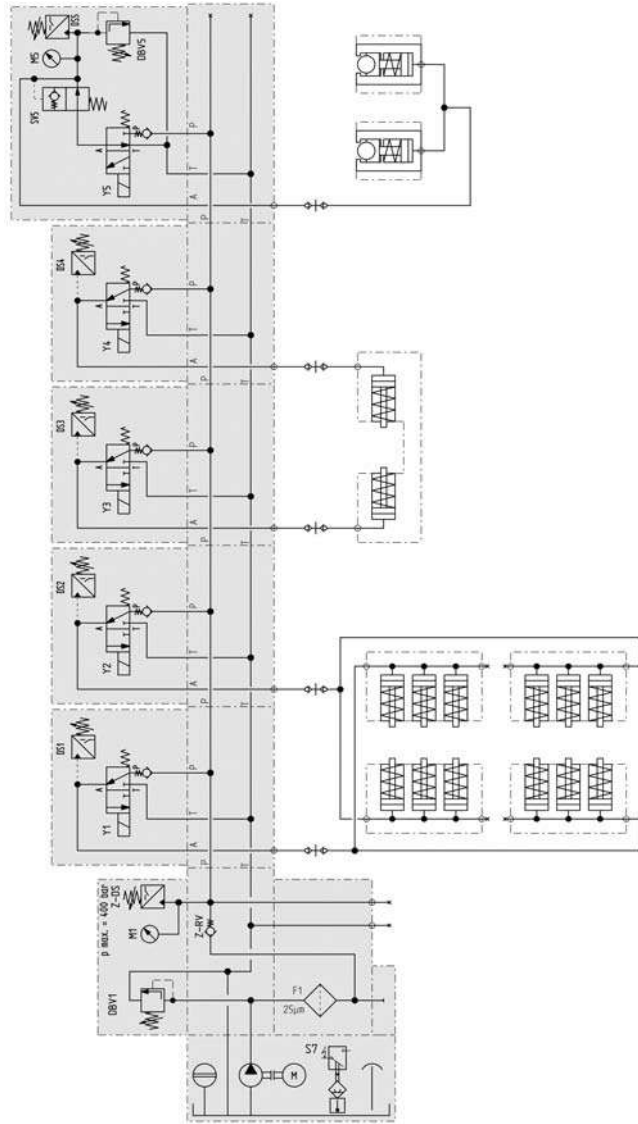

Wiring diagram for 4 clamping circuits

Pump unit with 4 clamping circuits for tool clamping at table and piston.

Wiring diagram for 5 clamping circuits

Pump unit with 5 clamping circuits for tool clamping at table and piston as well as additional actuation of the hydraulic ball-type roller bars.

Note:

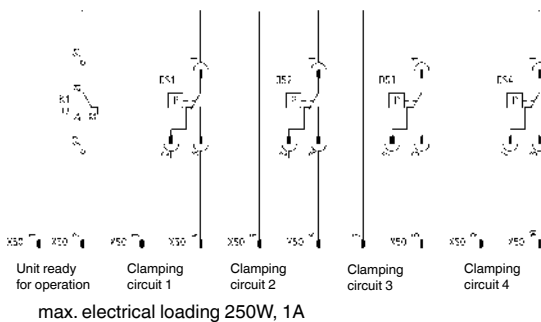

The pump unit must not start automatically when power supply is restored after a power failure. This does not apply to drive systems that may restart automatically without any risk of injury of operators or damage to the product to be processed. Note in accordance with VDE 0113-5.3: Safety in the event of power failure or pump unit failure.

Important note:

The external DS function of the pump unit can be integrated into the machine controller at the terminal housing by the operator. Ensure that the control circuit is correctly integrated into the machine controller!

External monitoring of AMF pump unit and pressure switches by customer's machine control

Attention! External voltage of external machine control

Attention! External voltage of external machine control

No. 6906PB-4-4

Remote Control Switch with magnetic base

for 4 clamping circuits

Order no.	Article no.	Control voltage	Number of poles	L x W x H	Weight [g]
61663	6906PB-4-4	24 V =	13	160x75x75	2300

Design:

Compact polyester housing with magnetic base. Illuminated push buttons with screening, insert labels for clamping circuits, 1-4. 5 m cable with 13-pin coupling connector, protection class IP 65.

Application:

For pump unit No. 6906P-64319, Order no. 326702.

No. 6906PB-4-5

Remote Control Switch with magnetic base and safety cover

for 4 clamping circuits

Order no.	Article no.	Control voltage	Number of poles	L x W x H	Weight [g]
60392	6906PB-4-5	24 V =	13	160x75x75	2500

Design:

Compact polyester housing with magnetic base, safety hood with lock. Illuminated push buttons with screening, insert labels for clamping circuits, 1-4. 5 m cable with 13-pin coupling connector, protection class IP 65.

Application:

For pump unit No. 6906P-64319, Order no. 326702.

No. 6906PB-6-4

Remote Control Switch

for 5 clamping circuits

Order no.	Article no.	Control voltage	Number of poles	L x W x H	Weight [g]
253823	6906PB-6-4	24V =	13	230x75x75	1910

Design:

Compact polyester housing. Illuminated push-buttons with screening for clamping circuits 1-4 and insert labels. Push buttons for clamping (green) and releasing (red), without screening for clamping circuit 5. 5 m cable with 13-pin coupling connector, protection class IP 65.

Application:

For pump unit No. 6906P-65319, Order no. 326728.

Note:

Clamping circuits 1 to 4 are for operating hydraulic clamping elements, circuit 5 is for raising the hydraulic ball-roller strip. The controls are so arranged that unintentional operation of one of the clamping circuits automatically retracts the hydraulic ball-rollers.

No. 6906PBS-1-1

Coupling Plug, 13-pin

without plug screw, without current bridge.

Order no.	Article no.	Control voltage	Number of poles	Weight [g]
126326	6906PBS-1-1	24 V =	13	40

Design:

Glasfibre-reinforced plastic with plug screw rugged version IP 65.

Application:

For connection directly to the machine control system. Suitable for pump unit and special units with 13-pin flange socket.

Subject to technical alterations.

No. 6945-22-20

Clamping Bar, short

single acting, with spring return,
max. operating pressure 400 bar, 1 clamping circuit.

Order no.	Article no.	Clamping force at 400 bar [kN]	Stroke [mm]	Vol. total [cm ³]	min. spring force per piston [N]	Weight [g]
61085	6945-22-20-1x3	60	6	8,7	120	3000

Suitable spacer bars:

Design:

Cylinder body made of tempering steel, phosphated. Piston case-hardened and ground, built-in return spring, with stroke limitation.

Application:

For quick clamping and unclamping on press table or ram. Suitable for workpieces with uniform clamping rim. The clamping bar is bolted with a spacer bar directly onto the press table or ram. Suitable spacer bars are No. 6945-22-04, -06, -07, -08.

On request:

Special sizes available on request.

Sectional view:

Clamping strip 6945-22-20-1x3 with exchangeable clamping pistons.

64006	6945-11-94x28x50	94	12	28,5	920	10380

Design:

Cylinder body made of tempering steel, blued. Piston case-hardened and ground. Built-in return spring, complete with locating pin.

Application:

The clamping head is used to clamp press tools on the press table and ram. The unit is inserted into the T-slot and moved above the clamping spot at the tool to be clamped. The clamping heads of size 20-63kN are suitable for a clamping height of 29 mm. Size 94kN suits a clamping height of 50 mm. To adjust other clamping heights, spacer plates of 10 mm and 20 mm are available.

Features:

Small dimensions. The hydraulic oil supply can be connected to any of the three sides.

Note:

If a clamping head is retrofitted with an spacer plate, the locating pin must be removed from the lower part of clamping head. T-Slot dimension F has to be considered urgently.

65490	6954-22	22	40 - 80	0 - 5	30	26	24	32	4,8	150	3320

Design:

Clamp (with swivel lock), clamping bolt and sleeve tempered and blued. Cylinder body made of tempering steel, blued. Piston and piston rod case-hardened and ground. Wiper at piston rod, venting screw and sinter metal breather. Long piston guiding and Teflon guide ring at piston.

Application:

The swivel clamping strap is intended for the most frequently occurring tool clamping heights.

Features:

Large clamping range, fast height adjustment to the required tool clamping edge height. The swivel clamping strap is inserted directly into the T-slot of the press. The workpiece can also be removed vertically upwards as the clamping bar can be swivelled away manually. The clamping bar is mechanically locked in the clamping position.

Note:

For single-acting cylinders, there is a risk of coolant being sucked through the breather port. In this case the cylinders have to be protected against the direct effect of coolant. The built in sinter metal breather should be protected. When placing into operation, ensure that all air is bled from the system.

On request:

Further sizes, specially made bases for bigger clamping heights and other T-slot sizes on request.

Please fill in the following form so we can use your data to prepare an offer for the right clamping system for your individual requirements. We will respond as soon as possible.

Design:

Block cylinder housing from steel, burnished. Housing and clamping bolt tempered. Piston rod case hardened and ground. The fastening screws are included in the supply scope resistance 12.9.

Application:

Wedge clamps are used for clamping the tools on presses and injection moulding machines. The clamping bolt clamps at a 20° diagonal to the tool, which results in a friction connection.

Note:

The maximum permitted load per clamp must not be exceeded. The clamping force acts vertically on the clamping point which applies very low sliding forces to the tool.

* When using fixing screws of 10.9 quality a maximum operating force of 400 bar is permitted. A mounting surface with corresponding thread resistance (at least corresponding to St 50) is required.

61390	6945-28-010	400	94	50	1200	66

Design:

Cylinder body made of tempering steel. External, vertical surfaces painted yellow. Complete with two clamping pistons No. 6945-15-10 and cover plates.

Application:

Clamping stud No. 6945-02-04-***, which is screwed into the tool, is gripped hydraulically when it has entered the opening in the clamping-pin chuck.

Note:

No DIN clamping studs must be used for the clamping stud holder. Mounting holes can be incorporated on request. Untoleranced dimensions are to DIN ISO 2768 medium.

On request:

Special versions available on request.

Also available separately as installation version (6945-15-10)

Dimensions:

No. 6945-15-10

Clamping Piston, complete

for stud clamping,
max. operating pressure 400 bar.

Order no.	Article no.	Screw (6 items)	Md max. [Nm]	OR-1 O-ring Order No.	Weight [g]
61382	6945-15-10	M10 x 25	50	188300	1700

Design:

Hydraulic piston from hot workable steel, tempered and ground. Cover from hardened steel. Complete with disc springs, O-rings, support rings, dowel pin and fastening screws ISO 4762 resistance 8.8.

Application:

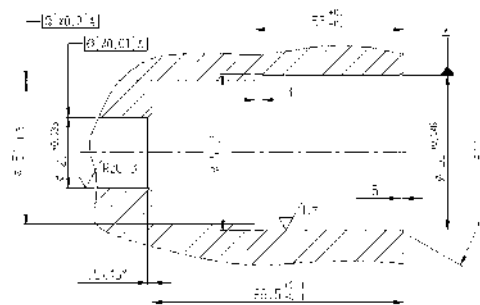

This clamping piston can be retrofitted to your original ram plate.

Note:

The use of clamping stud No. 6945-02-04-009 in combination with clamping piston set No. 6945-15-10 is restricted to a maximum operating pressure of 230 bar.

Installation dimensions:

WE DEVELOP THE RIGHT SOLUTION – POTENTIAL SAVINGS BY REDUCING SET-UP TIMES

As a system provider with its own production facility, not only do we have the right product for every need. With many years of experience from all fields of clamping technology we develop the perfect solution for different industries, special projects and for very individual requirements.

With full concentration on a single project, an entire team supports you at AMF, which unites all facets for a successful result.

In close cooperation and with short communication channels, our experienced experts from sales, proposal preparation and purchasing work together with our engineers and designers from the development and production departments.

Thus, we can always ensure that all criteria for a cost-effective production process are met – our specialists look forward to exciting new challenges.

Just talk to us!

**We will be happy to advise you
during your current project.

A		D	
Accumulator	301	Coupling mechanism, installation design	280
Adapter for pressure gauge connection	309	Coupling mechanism, threaded design	278
Adapter Plate, light duty	329	Coupling nipple, installation design	282
Adaptor	320	Coupling nipple, threaded design	279
Adaptor Plate	356	Coupling Plug	32
Air filter and pressure regulator	16	Coupling Plug, 13-pin	345
Air-Hydraulic Pump	14, 15	Coupling Unit for Pallet Decoupler Block	300
AI Protection MK/SK	315	Cross-fitting, heavy-duty	325
Angle block, 120°	78	Cross-fitting, light duty	329
Angle Swivel Joint, 90° single passage	290	D	
Anti-rotation device	135	Delay valve	258, 259
Automatic coupling mechanism, threaded design	284	Directional valve 4/3	16
Automatic coupling nipple, threaded design	286	Diverter plate	17
Axial Swivel Joint, single passage	290	E	
B		Electronic pressure switch	266, 267
Base for Clamping Head	355	F	
Block Cylinder	58, 59, 60, 62, 70, 71	Failover with ball	333
Block cylinder with O-ring connection on base	66	Failover with roll	332
Block cylinder with O-ring connection on rod side	68	Filter	304
Block cylinder with O-ring connection on side	64	Filter, cartridge design	306
Bore clamp, hydraulic, centric	170	Filter plate	228, 255
Bore clamp, hydraulic, eccentric	172, 174, 176	Filter, threaded design	306
Bore clamp MAXI, hydraulic, centric	180	Filter with rectifier circuit	305
Bore clamp MINI, hydraulic, centric	178	Fitting, angled, adjustable, heavy-duty	325
Breather screw with filter	322	Fitting, angled, heavy-duty	325
Built-In Cylinder	44, 45, 46, 47	Fitting, angled, light duty	328
Bulkhead fitting, straight, heavy-duty	326	Flange Nut	48
Bulkhead fitting, straight, light duty	329	Flange with pipe socket	269
C		Front Insertion Guide	352
Centring clamp MAXI with three clamping points	197	G	
Centring clamp MAXI with two clamping points	196	Gauge	317
Centring clamp MINI with three clamping points	195	H	
Centring clamp MINI with two clamping points	194	Hand Pump	11
Chain clamping set	74	HELI-COIL thread insert	38
Check valve, hydraulically pilot operated	273	High Pressure Hose	314
Check valve, pilot operated	273	High Pressure Hose with steel-wire interlace	314
Clamp chain protection set	76	Holder for Clamping Head	354
Clamping arm	147, 150, 154, 237	Hollow Rod Cylinder	36, 38, 39
Clamping arm, blank	147, 154, 158, 162, 166	Hollow Rod Cylinder with internal thread	37, 40, 41
Clamping arm blank	150, 237	Hook end, mechanical	75
Clamping arm blank from aluminium	141	Hook ends, hydraulic	73
Clamping arm blank from steel	135, 140	Hydraulic Compensating Clamp	222
Clamping arm out of aluminium	137, 141	Hydraulic intensifier	12
Clamping arm out of steel	135, 137, 140	Hydraulic oil	315
Clamping arm, standard	158, 162, 166	Hydraulic pipe	327
Clamping Bar, long	348, 349	Hydraulic pressure booster	13
Clamping Bar, short	347	L	
Clamping Head	355	Line Check Valve	272
Clamping Head, complete with base	354	Link clamp	156, 234, 235, 236
Clamping jaw, serrated	191	Link Clamp	160, 164
Clamping jaws blank, smooth	191	M	
Clamping Jaws, serrated	187	Manifold	317
Clamping Jaws, soft	187	Manual Seat Valve, 2/2-Way	262
Clamping Jaws, with clamping edge	187	Manual Seat Valve, 3/2-Way	262
Clamping lever blank	225, 228	Measuring coupling	308
Clamping lever, cranked	225	Measuring hose	308
Clamping lever, standard	225	Mounting kit	79
Clamping Piston, complete	356, 362	O	
Clamping Stud	362	Open ring spanner with torque-wrench fitting	79
Clamping Stud Holder, hydraulic	361	P	
Clamping tongs	226, 227	Pallet Decoupler Block	298, 299
Compensating collet	224	Piston Pressure Switch	268, 269
Connecting links with spring cotter pin	77	Pivoting fitting, angled, heavy-duty	324, 326
Connecting plate	260	Pivoting fitting, angled, light duty	328
Connecting Plate	250	Pivoting T-fitting, heavy-duty	324, 326
Connection journal	320	Pivoting T-fitting, light duty	328
Connection Plate	262, 268	Plug connection	287
Connection plate for centring clamp	198	Pressure control seat valve	251, 252, 253
Counter catch	75	Pressure gauge, with housing	316
		Pressure Reducing Valve	250
		Pressure Relief Valve	257
		Protective elements	77
		Pull Cylinder, base-flange-mounting, with guided piston rod	88

... IN ALPHABETICAL ORDER

Description	Page
Pull Cylinder, block type	82
Pull Cylinder, thread-flange-mounting, with guided piston rod	92
Pull Cylinder, top-flange-mounting, with guided piston rod	84
Pull-Down Clamp	188
Pull-Down Clamp, hydraulic	184, 185
Pull-Down Counter-Hold, mechanical	186
Pump unit	18, 20, 24, 26
Pump Unit	340, 342
Push-Pull Cylinder, base-flange-mounting, with guided piston rod	89, 91
Push-Pull Cylinder, thread-flange-mounting, with guided piston rod	93
Push-Pull Cylinder, top-flange-mounting, with guided piston rod	85, 87

S	
Screw plug	321
Screw Pump	10
Screw-in fitting, straight, heavy-duty	324, 326
Screw-in fitting, straight, light duty	328
Screw-in flange	320
Screw-up fitting, straight, heavy-duty	324
Seat Valve 3/2	16
Seat Valve, 3/2-Way	263, 264
Seat Valve, 3/3-Way	265
Seat Valve, 4/3-Way	16, 265
Sequence valve	260
Sequence Valve	254, 255, 257
Sequence valve, threaded design	129, 256
Set screw	336
Set screw, ball-shaped	336
Shape A sealing ring Cu	321
Shut-off valve	274
Shuttle Valve	272
Side clamping element with support	191
Side clamping element without support	190
Side thrust piece, with seal	335
Spacer Bar	350-352
Splash protection	216
Spring cotter pin	76
Store Station for Coupling Unit	300
Support control, pneumatic	310, 311
Support Element, base-flange-mounting	205-208
Support Element, block type	202
Support Element, cartridge flange	204, 210-214, 246
Support element, flange design with dynamic pressure monitoring	219
Support element, threaded design with dynamic pressure monitoring	218
Support Element, top-flange-mounting	244
Surface-mounted block	142, 159
Surface-mounted housing	32
Swing Clamp Arm, double ended	117, 127
Swing Clamp arm, double-ended	118, 128
Swing Clamp Arm, long	117, 127
Swing Clamp Arm, standard	116, 126
Swing Clamp Arm, upreach	116, 126
Swing clamp, base-flange-mounting, precision design	112, 114, 124, 125
Swing clamp, cartridge flange, precision design	102
Swing clamp, plug-in mounting	104
Swing Clamp, thread-flange-mounting	96, 97
Swing clamp, top-flange-mounting	230
Swing clamp, top-flange-mounting, precision design	108, 110, 122, 123
Swivel Clamping Strap, hydraulic clamping, mechanic unclamping	357

These Terms of Payment apply for companies, legal entities governed by public law and public law special funds. Our goods and services are supplied exclusively on the basis of the following conditions. Any deviating purchasing conditions of the customer not expressly recognised by us will not become part of the contract through acceptance of the order. By placing the order and accepting the goods we deliver, the customer confirms its consent to our terms and conditions.

1. Offer and contractual conclusion

All our offers are always subject to change without notice unless otherwise explicitly agreed. Our delivery contracts are based on the latest version of our catalogue. Dimension and weight values, as well as illustrations, drawings and data, are non-binding and can be changed by us at any time. Therefore, deviations cannot be ruled out and do not justify any compensation claims against us.

Orders are considered accepted only when confirmed by us in writing. If, for organisational reasons, the customer does not receive a separate confirmation upon the delivery of goods, the invoice shall also be deemed the order confirmation.

2. Prices

The prices are in EURO, ex-works, excluding VAT, packing, freight, postage and insurance. Unless otherwise agreed, our list prices valid on the day of delivery shall apply. For orders below 50 EUR goods net, we must make a minimum quantity surcharge of a 10 EURO for cost reasons.

3. Tool costs

Unless any other agreements have been reached, the tools fabricated for the purpose of executing the order shall remain our property in all cases, even if we have invoiced a tool cost component separately.

4. Payment

Unless otherwise stated on the invoice, the purchase price falls due for net payment within 30 days of the invoice date (without deduction of discount). Invoice amounts of below 50 EURO are due for payment immediately.

In case of payment default, we shall be entitled to charge default interest. The amount corresponds to our interest rate for current account credits at our main bank; the minimum however being 8 percentage points above the relevant base interest rate applied by the European Central Bank. Moreover, in case of default following written notice to the customer, we shall be entitled to cease to fulfil our obligations until payments are received.

5. No set-off

The customer can set-off only with legally confirmed or undisputed counterclaims.

6. Right of withdrawal in case of delayed acceptance or payment and insolvency

If the customer fails to accept the goods in due time, we shall be entitled to set a reasonable period of grace, after which we can dispose of the goods elsewhere and supply the customer on a reasonably longer term. Our rights to withdraw from the contract under the provisions of Section 326 BGB and demand damages for non-performance shall not be affected. If the customer fails to pay for the goods once payment is due, we shall be entitled, at the end of a reasonable period of grace we have set, to withdraw from the contract and demand the return of any goods already supplied. Section 323 BGB remains unaffected in all other cases.

If the customer applies for the opening of insolvency proceedings, we shall be entitled, prior to the ordering of security measures by the insolvency court, to withdraw from the contract and demand the immediate return of the goods.

7. Customer-specific fabrications/project fabrications (custom fabrications)

Customer-specific fabrications require binding information on design, quantity etc. in written form at the time of ordering. For manufacturing reasons, we reserve the right to supply up to 10% above or below the order quantity. Technical modifications or cancellations are subject to any costs incurred. The return of customer-specific fabrications is impossible.

8. Delivery and packaging, transfer of risk

The delivery date is non-binding; although stated to the best of our knowledge. It is subject to us receiving correct, defect-free and complete deliveries. The stated delivery dates relate to completion in the factory, starting on the day the order is accepted by us. Delivery is EXW (ex-works) in accordance with Incoterms 2010. Therefore, the costs are borne by the customer. The risk is transferred to the customer when the goods are passed to the person, company or facility nominated to execute the shipment. This applies also for partial deliveries, or if we have assumed responsibility for delivery and installation. The risk shall be transferred to the customer even in the case of delayed acceptance.

In the absence of specific shipping instructions, we shall proceed as we deem fit and without any obligation to the cheapest or most expedient method. The customer agrees that the order can also be delivered in parts, insofar as this is reasonable for the customer. We shall charge a 5 EURO processing free for shipping to third parties that we supply on behalf of the customer.

The packaging complies with the packaging ordinance. Disposable packaging shall be charged at cost price. The packaging cannot be taken back.

9. Performance impediment and/or impossibility

If we are hindered in the fulfilment of our obligation due to the onset of unforeseeable circumstances, which we are unable to avoid despite reasonable effort in relation to the nature of the circumstances (e.g. operational interruption, delay in the delivery of important raw materials, defects in the delivery), the delivery time shall be extended by a reasonable period, insofar as the supply of goods or services is not rendered unreasonably difficult or impossible.

If we have to accept that these circumstances are not only temporary, we shall be entitled to withdraw from the contract either in whole or in part.

If the supply of goods or services becomes impossible, the customer shall not be obliged to furnish its own contractual service. Section 275 BGB applies mutatis mutandis. If, however, the customer is solely or predominantly responsible for the

circumstances that led to impossibility, it shall remain under an obligation to render the return service. The same applies if this circumstance occurs at a time when the customer is behind schedule with acceptance.

10. Samples/returns

Samples shall be provided only against payment. If samples or models are provided, a credit note shall be issued with the subsequent order if the order value is 125 EURO net or more. Goods can be returned only by agreement, although custom fabrications are excluded from such return.

In the case of returns for which we are not responsible (e.g. incorrect order), we shall charge a processing fee of 10%, the minimum value, however, being 7.50 EURO.

11. Retention of title

The goods shall remain our property unless full payment of all claims and/or until the cheques provided for this purpose are honoured. The itemisation of claims in an ongoing invoice, as well as balancing the account and the recognition thereof does not affect the retention of title. The customer is entitled to sell on the retained goods during the ordinary course of business. However, the customer is not permitted to pledge the goods or transfer them by way of security. It shall assign its claim ensuing from the selling on of the retained goods to us in advance. The customer shall be entitled to collect the claim to the extent that it has fulfilled its obligations towards us. At our request, the customer shall be obliged to state third-party debtors and we shall be entitled to report this and the assignment.

12. Property rights

We reserve property rights and copyrights to all contractual documents such as drafts, drawings, calculations and cost estimates. Such documents must not be reproduced or disclosed to third parties without our consent. Any rights to patents, utility models etc. reside solely with us, insofar as such patents have not yet been filed. Our products are allowed to be replicated only with our written consent.

If objects are fabricated according to drawings or samples, the customer shall warrant that any third party property rights are not infringed by manufacture or delivery. If a third party forbids manufacture and delivery on account of property rights, we shall be entitled to stop manufacture and delivery immediately. The customer shall be obliged to reimburse us with all costs incurred and indemnify us from third party compensation claims. Compensation claims by the customer are impossible.

13. Warranty

If the customer agrees with us a particular quality of the goods, we shall base this agreement on our technical delivery specifications. If we have to deliver according to customer drawings, specifications, samples etc., the customer shall assume the risk for suitability for the intended purpose. If, after the contract is concluded, the scope of goods or services is changed at the customer's request and this impairs the quality or suitability of the goods, claims for defects on the part of the customer shall be ruled out, insofar as such impairments are caused by the customer's requests for change.

The time at which the risk is transferred is decisive for the contractual state of the goods. Wear and tear of wearing parts caused by ordinary use does not constitute a defect. Claims for defects are ruled out in the following cases in particular: Unsuitable or improper use, incorrect installation and/or commissioning by the customer or third party, normal wear and tear, incorrect or negligent handling - in particular excessive use -, unsuitable equipment, replacement materials, chemical, electrochemical or electrical influences, unless such defects are caused by ourselves.

If the goods contain a defects, we shall provide, following a reasonable period of grace set by the customer, either a replacement or a repair as we deem fit. If such subsequent performance fails, the customer shall be entitled to either reduce the purchase price or withdraw from the contract. Any further warranty claims are ruled out. In case of negligible deviations from the agreed quality, no claims for defects shall be recognised.

The discovery of defects must be communicated to us immediately in writing. In the case of recognisable defects, however, within 10 days of acceptance, in the case of non-recognisable defects immediately after they become evident. The warranty is 12 months, starting with delivery of the goods ex-works.

14. Liability

With the exception of harm to life, body or health on account of a breach of duty by ourselves, our liability shall be limited to intent or gross negligence.

15. Place of fulfilment, place of jurisdiction and governing law

The place of fulfilment for all obligations ensuing from this contractual relationship is D-70734 Fellbach.

The place of jurisdiction for all legal disputes ensuing from the contractual relationship is the court responsible for the headquarters of Andreas Maier GmbH & Co. KG.

All disputes ensuing from the contract or regarding the validity thereof shall be finally decided by a court of arbitration in accordance with the Court of Arbitration Ordinance of the German Committee for Arbitration Court Procedures or the Conciliation and Arbitration Arrangement of the International Chamber of Commerce, recourse to ordinary courts of law being excluded. The legal dunning process, however, remains permissible.

German law shall govern (BGB and HGB). The applicability of the UN Convention on Contracts for the International Sale of Goods (CISG) is ruled out.

16. Severability clause

If individual provisions become legally invalid, the remaining provisions shall not be affected. The legally invalid provision shall be replaced by regulations that most closely reflect the economic purpose of the contract with reasonable consideration for the mutual interests. The publication of these Terms of Sale, Delivery and Payment renders all previous versions invalid. This does not apply for any contracts concluded prior to announcement.
